CN MOST flagship projects OPTIFaaS and scalability project SASUAM
CISOSE 2025, IEEE BigDataService 21 - 24 July 2025 Tucson, Arizona, United States

- **Controlling Status:** management, and operational
 - Monitoring via KPI
 - Predictions vs KPI
 - Anomaly detection
 - Neuro-Symbolic analysis
 - Risk assessment
 - Early warning on critical conditions
 - Fast What-if analysis
- **Making plan:** tactic and strategic, medium and long range, micro/macro
 - Simulation & optimization
 - Generative AI Prescriptions, scenarios
 - Resilience to Unexpected unknowns
 - What-if analysis wrt scenarios
 - Collaboration with stakeholders

Digital Twin Development Platform

The Challenge: Complex Smart Cities

Increasing complexity of smart city systems, especially mobility and transport

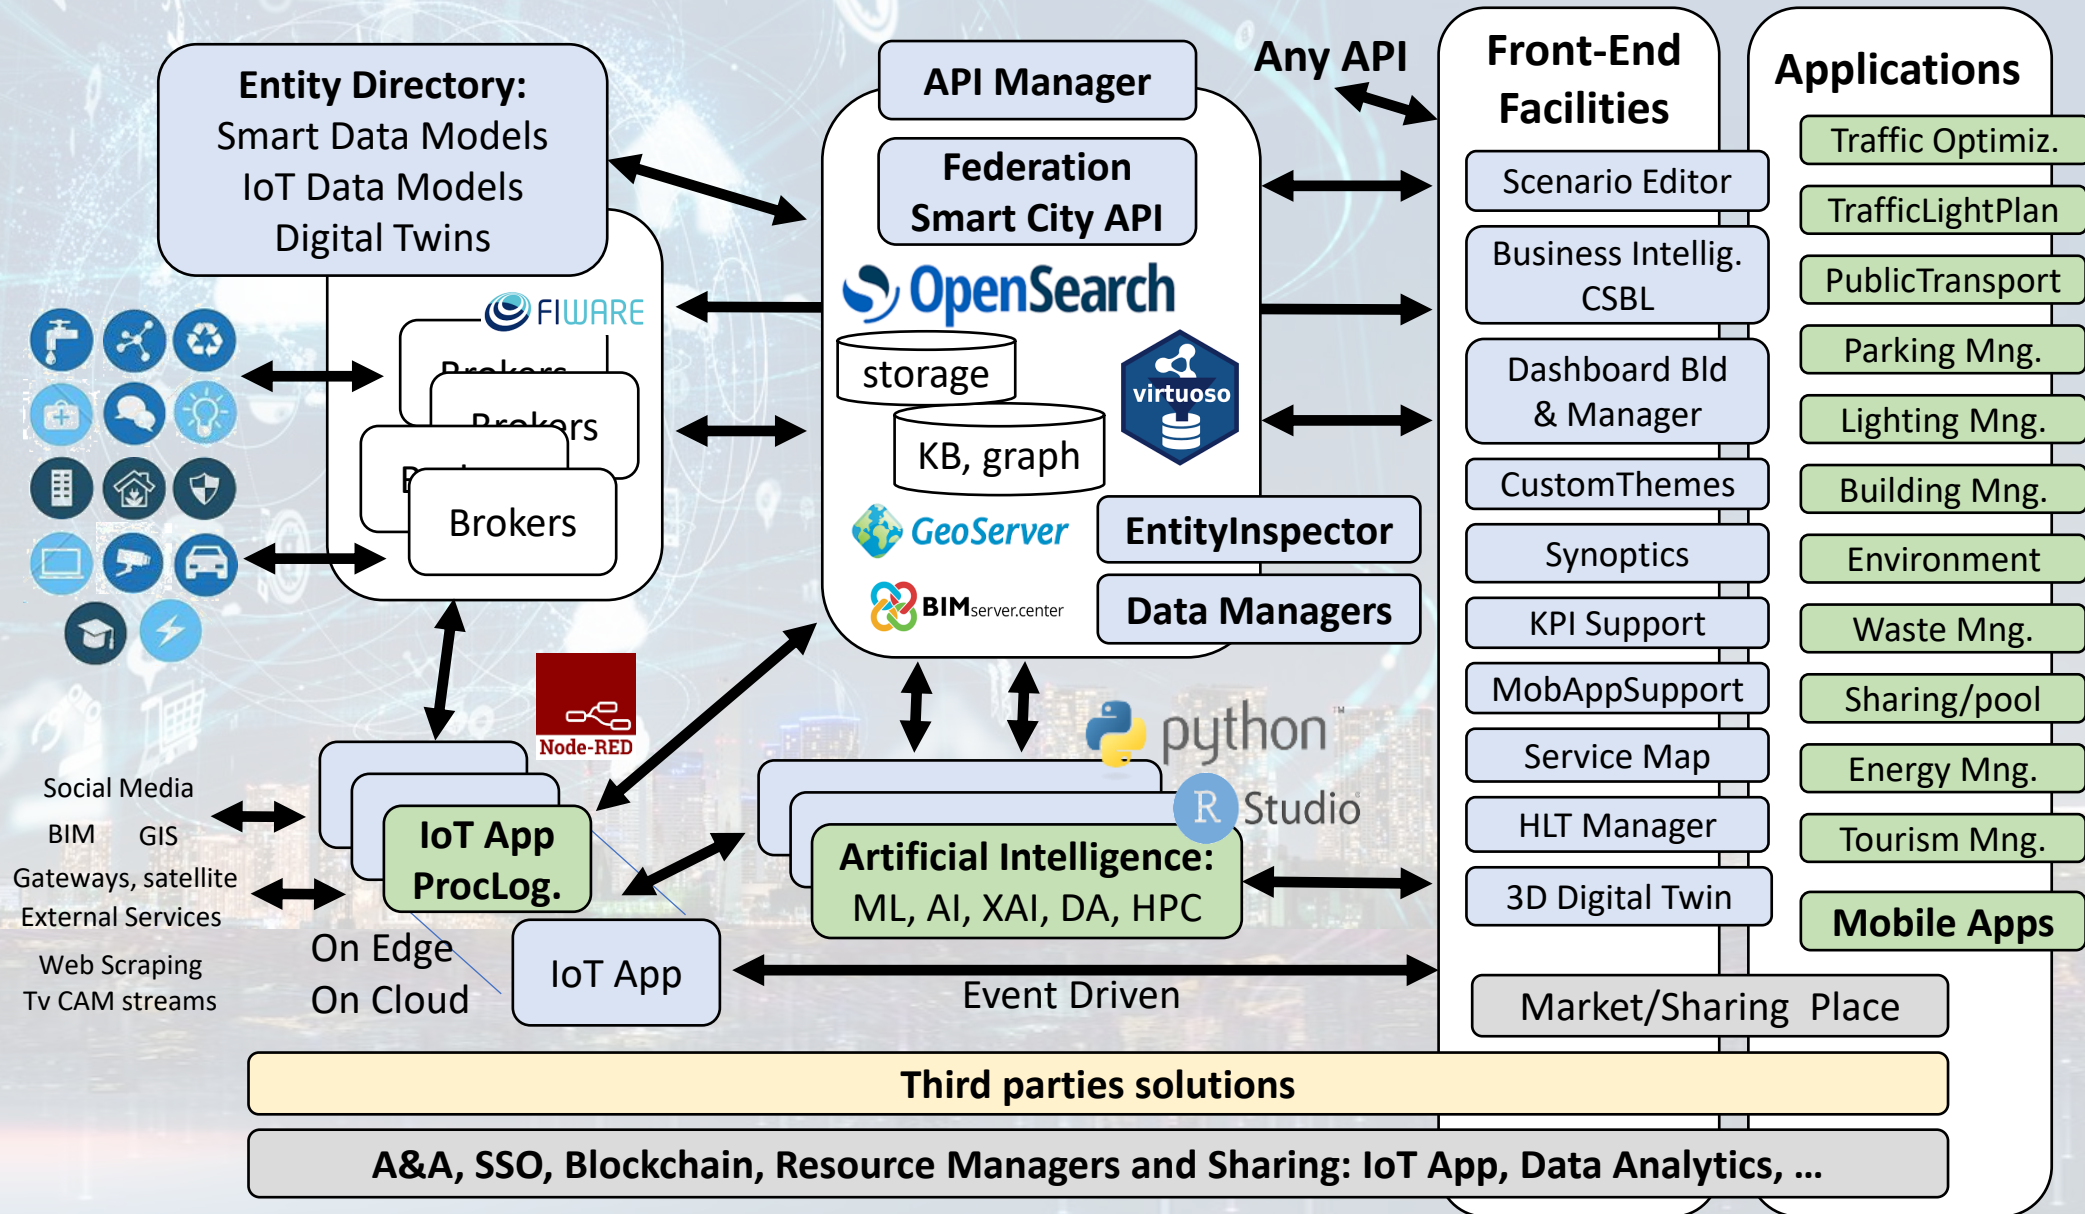

Traditional what-if analysis:

- Human-driven, "try-n-error" process
 - Low automation
 - Limited scalability; cannot fully exploit cloud/container capabilities for large trials

Heterogeneity of processes: Simulations, Optimizations, predictions, ...

- Multiple behavioral aspects (vehicle agents, routing, routing, pollutant diffusion, traffic light optimization optimization)
- Different paradigms (discrete-event, agent-based, based, reinforced learning, LLM, GA, ...)
- Various spatial and temporal scales (micro-, meso-, meso-, macro)
- scalability of executions of the processes
- accountability of resource consumption, allocation allocation

BEFDIT Behavior Execution Framework for Digital Twins

Orchestrates heterogeneous behavioral Simulations, predictions, reconstruction, classification, causality, anomaly detection, Routing, ODM prod., ..

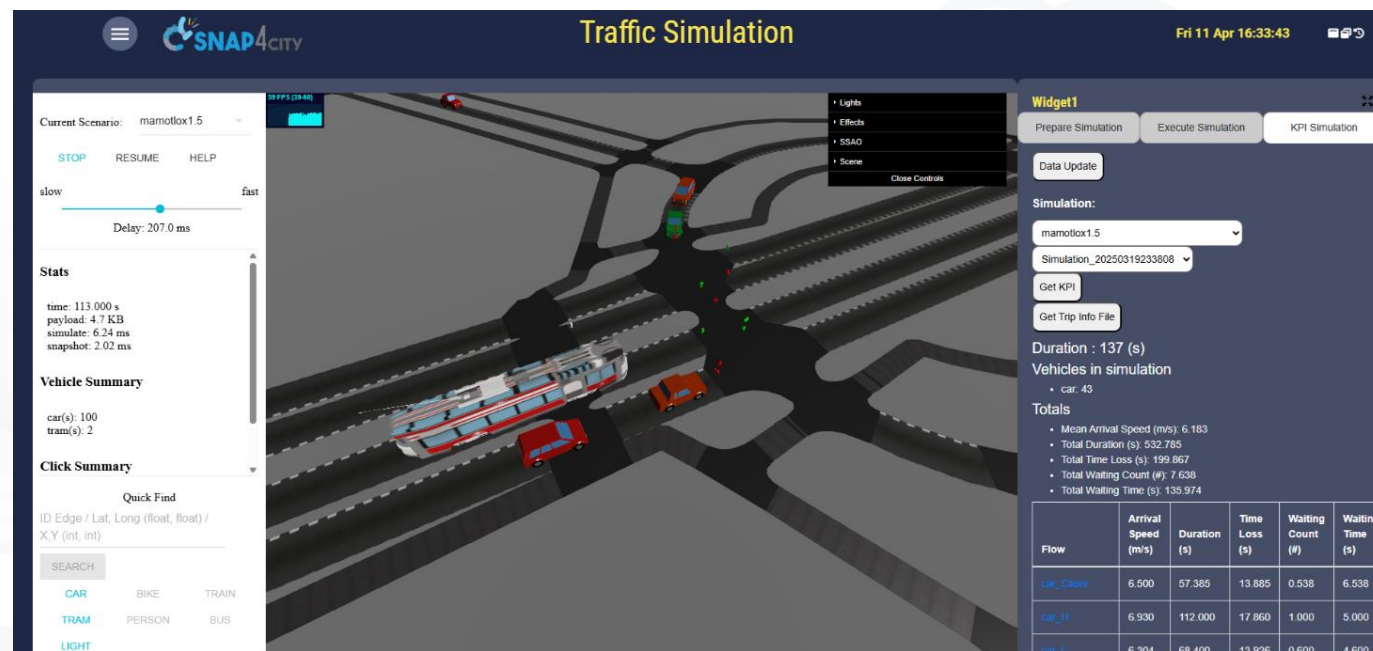

Supports co-simulation and co-execution of multiple tools, multiple instances (open-source & proprietary)

Leverages cloud/container-based infrastructures

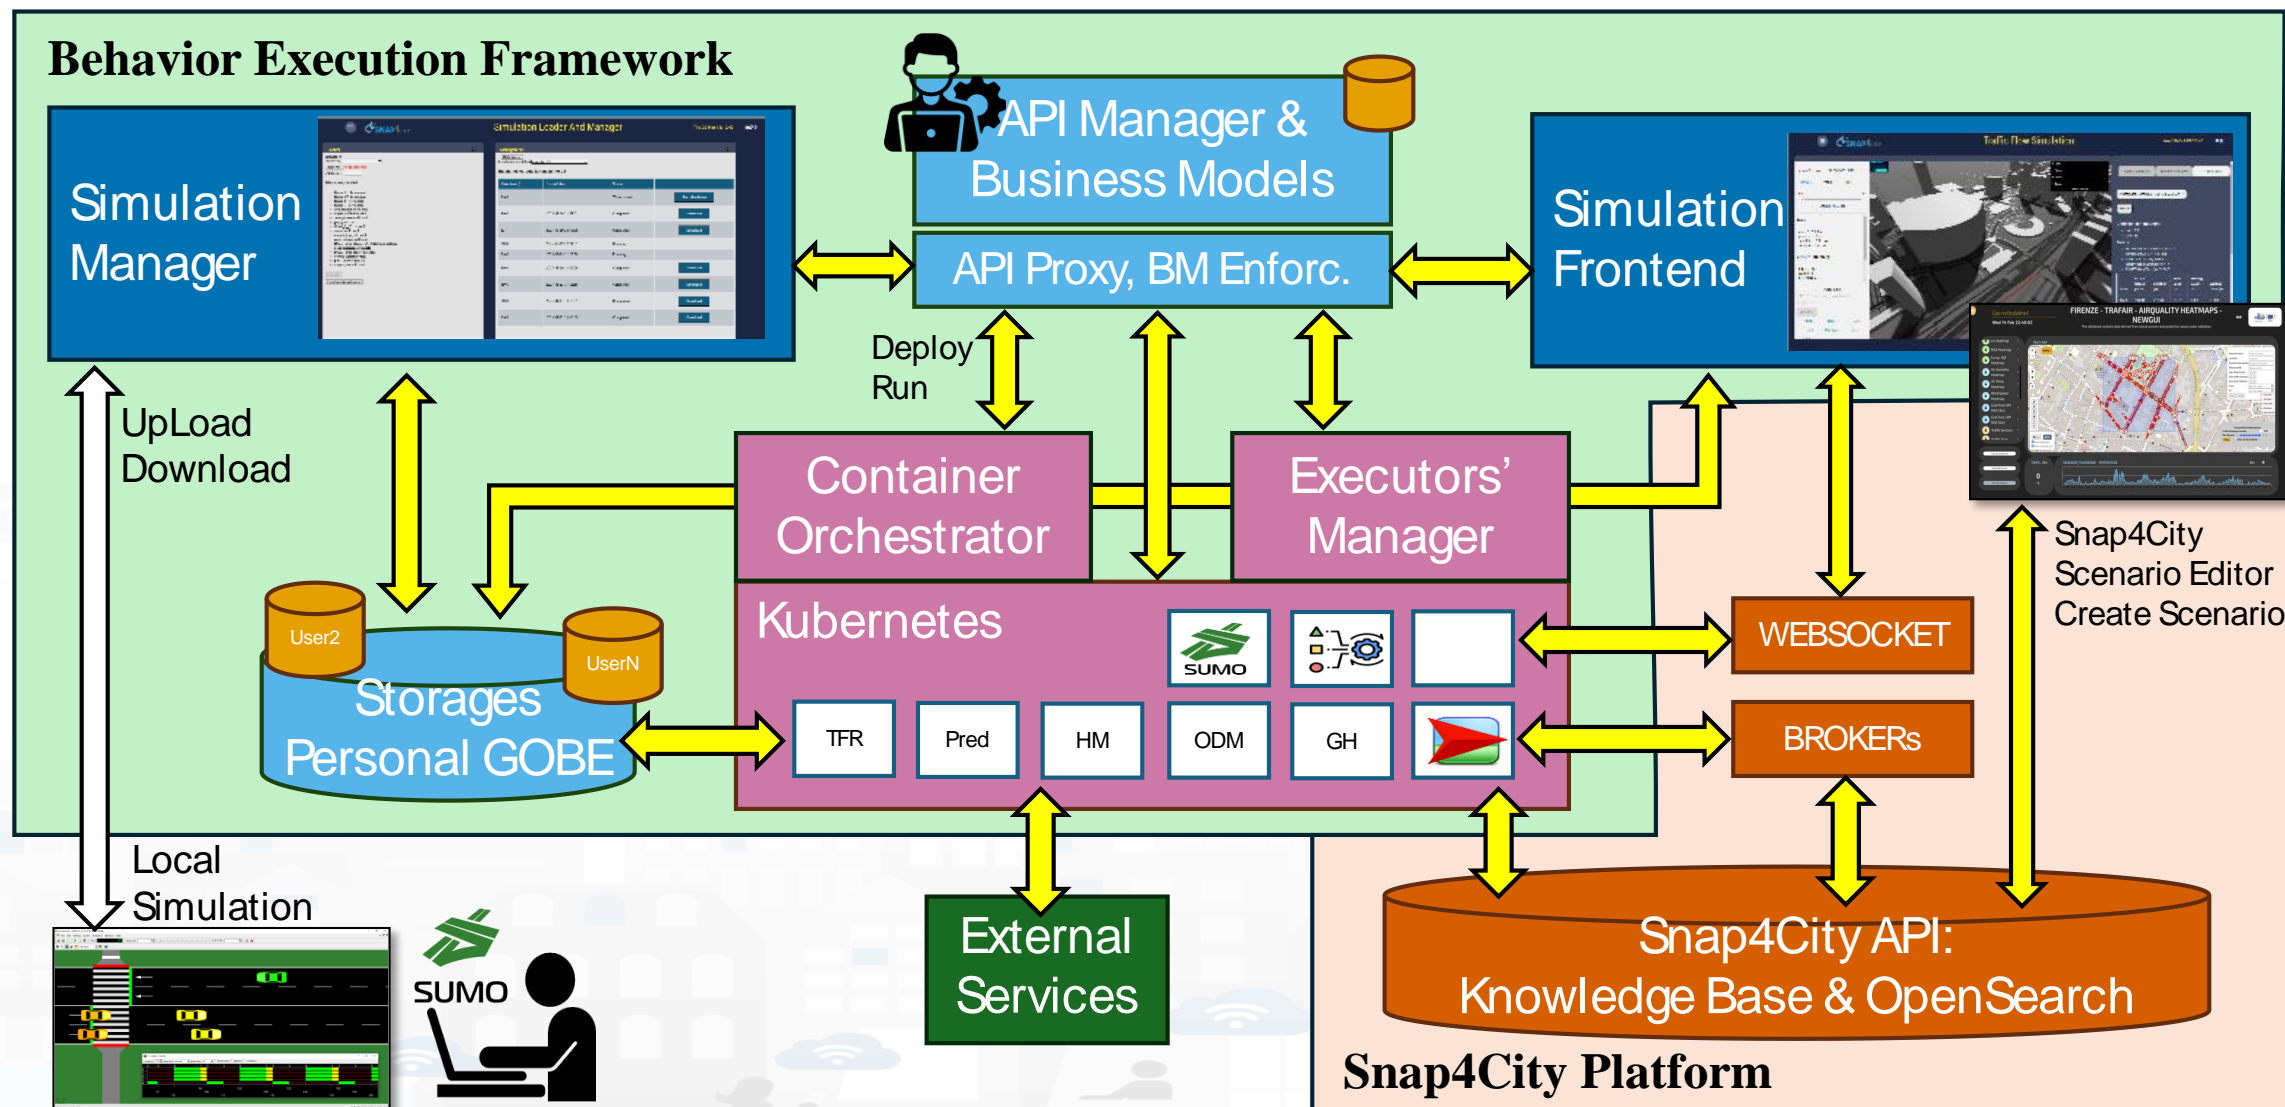

Optimization ready and not only What-If Ready

Facilitates real-time and offline management of simulations, executions

Integrated into Snap4City Open-Source platform.

BEFDIT Architecture

BEFDIT – Core Contributions & Requirements

- **R.1: Support for Various Behavioral Executors (BEXs):** Modular architecture for diverse algorithms (statistical, ML/AI, operational research), Supports BEXs in different languages from various providers, Examples: vehicle agents, routing, pollutant diffusion, traffic predictions
- **R.2: Groups of Behavioral Executions (GOBE):** Multiple BEXs towards a shared goal within a "Scenario", Activated programmatically or via web GUI
- **R.3: Support for Independent BEXs:** Concurrent execution of multiple instances of same or different BEXs, Each BEX deployed as a container on cloud, by diff. users, diff. contexts, etc..
- **R.4: Interoperable BEXs:** Supports various communication protocols (API, Web Services, files) for data exchange
- **R.5: Web-Based Support for GOBE:** GUI for setup, monitoring, monitoring, results. Dashboards for real-time visualization and parameter adjustments. Dashboards results for decision-makers makers
- **R.6: GOBE as a Service with Scalable Resource Allocation:**
Allocation: Dynamically allocates computational resources (CPU, GPU, (CPU, GPU, memory, storage, API) Optimizes performance via load load balancing and adaptive scaling
- **R.7: Persistent Simulation Data Model:** Cloud-based storage for storage for Scenarios, GOBE setups, and results. Version control and and rollback options; allows resume/replay/analysis of past runs runs
- **R.8: Users' Management: Supports multiple users with different roles (admin, operators, users):** Manages access and usage

The main interface displays a map with various road segments represented by colored lines and arrows. A left toolbar contains icons for map selection, zooming, and editing. A top-right panel allows for scenario configuration, including name, location, description, and sensor settings. A bottom-right panel shows the 'Road Types' list with checkboxes for selecting or unselecting different road categories. A bottom-left panel shows view and edit options, including checkboxes for 'Show Road graph' and 'Show Traffic Sensors', and a 'Filter by road types' button.

Predictions and Heatmaps in Real Time

BEFDIT & SUMO – Urban Mobility Simulation

SUMO (Simulation of Urban Mobility) example

Two main modes:

Local Setup, Cloud Execution

- Prepare SUMO scenarios locally (e.g., NetEditor)
- Upload to BEFDIT/Snap4City for execution in the cloud
- Results available via download or real-time (SUMO Web3D via WebSocket)

Full Snap4City Workflow

- Scenario creation via Snap4City tools (e.g., Scenario Editor)
- Automatic versioning, cloud conversion to SUMO input (via Kubernetes microservice)
- Easy integration of real-time data

Simulation Workflow & Co-Simulation

Define/upload scenario

- Area → bounding box
- Timespan → datetime range
- Demand → ODMs

Convert to SUMO input (network, routes)

Run (offline/online with Web3D)

Analyze results via KPIs (e.g., speed, time loss, waiting time)

Co-Simulation

- Integrates SUMO with other BEXs (e.g., GraphHopper for dynamic routing)
- Enables congestion avoidance, road closures, smart infrastructure tests
- Managed via Kubernetes clusters and scalable microservices

From Simple Simulation to scalability

SUMO produces real-time outputs (e.g., traffic status, traffic light plans)
Data injected into Snap4City via virtual sensors

Supports:

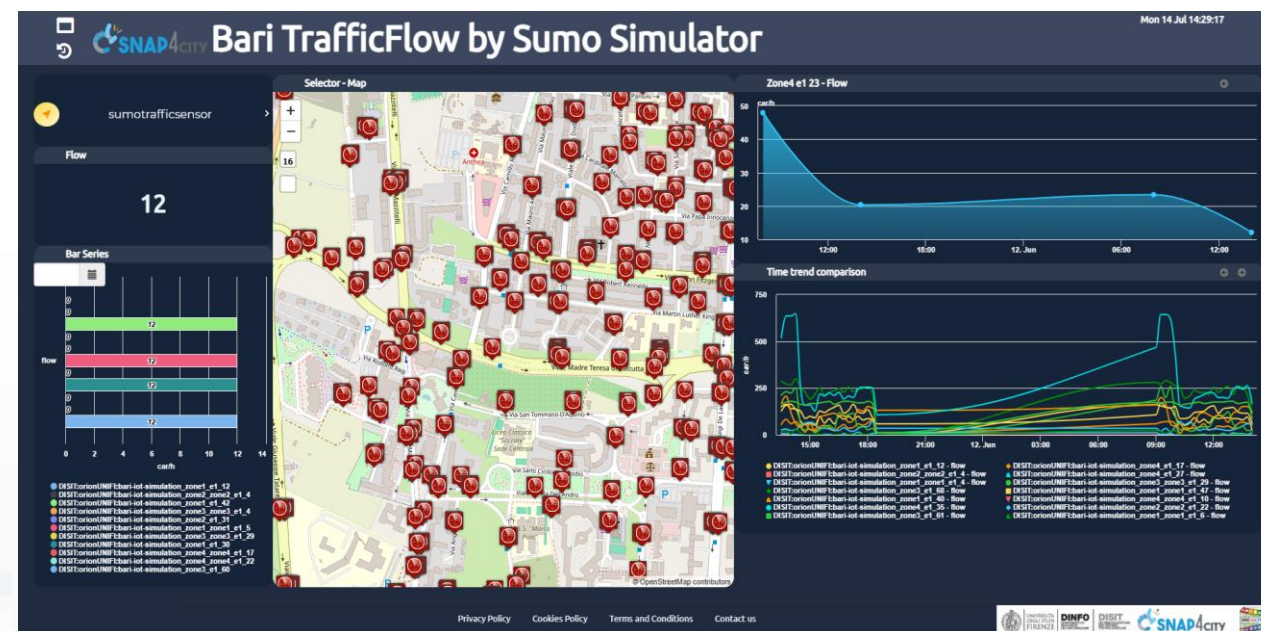

- Dashboards & analytics
- Smart city service testing
- Predictive model validation
- Backup during sensor failures

Scalability & Performance

- 3,351 simulation operations/month
- 200,000+ routing requests (e.g., Florence) via GraphHopper
- 10,000+ flows for RL training

Complex spatial scenarios supported:

- Helsinki/Antwerp: 5.3M roads
- Greece: 6.7M roads
- Other areas: up to 13M roads

Traffic Light Plan Optimisation, Digital Twin

- **Match Multiple Objectives and Synchronization:**

- public and private traffic, tramway priority
- Micro and Macro Scales

- **AI: Genetic Algorithms, Deep Reinforced Learning**

- Fixed and Actuated Cycles
- Adjusted on Demand

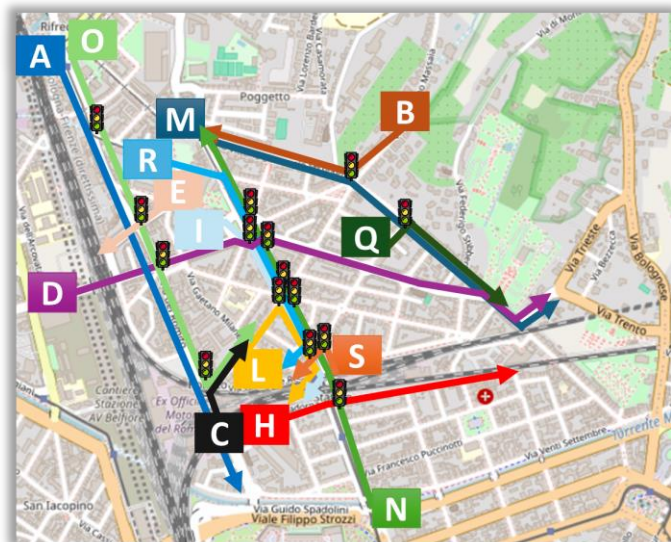

- **Validation/integ.** with *SUMO* simulation

- Travel Time, waiting time, waiting count
- Specific travel time on directions
- CO2 emissions, etc.

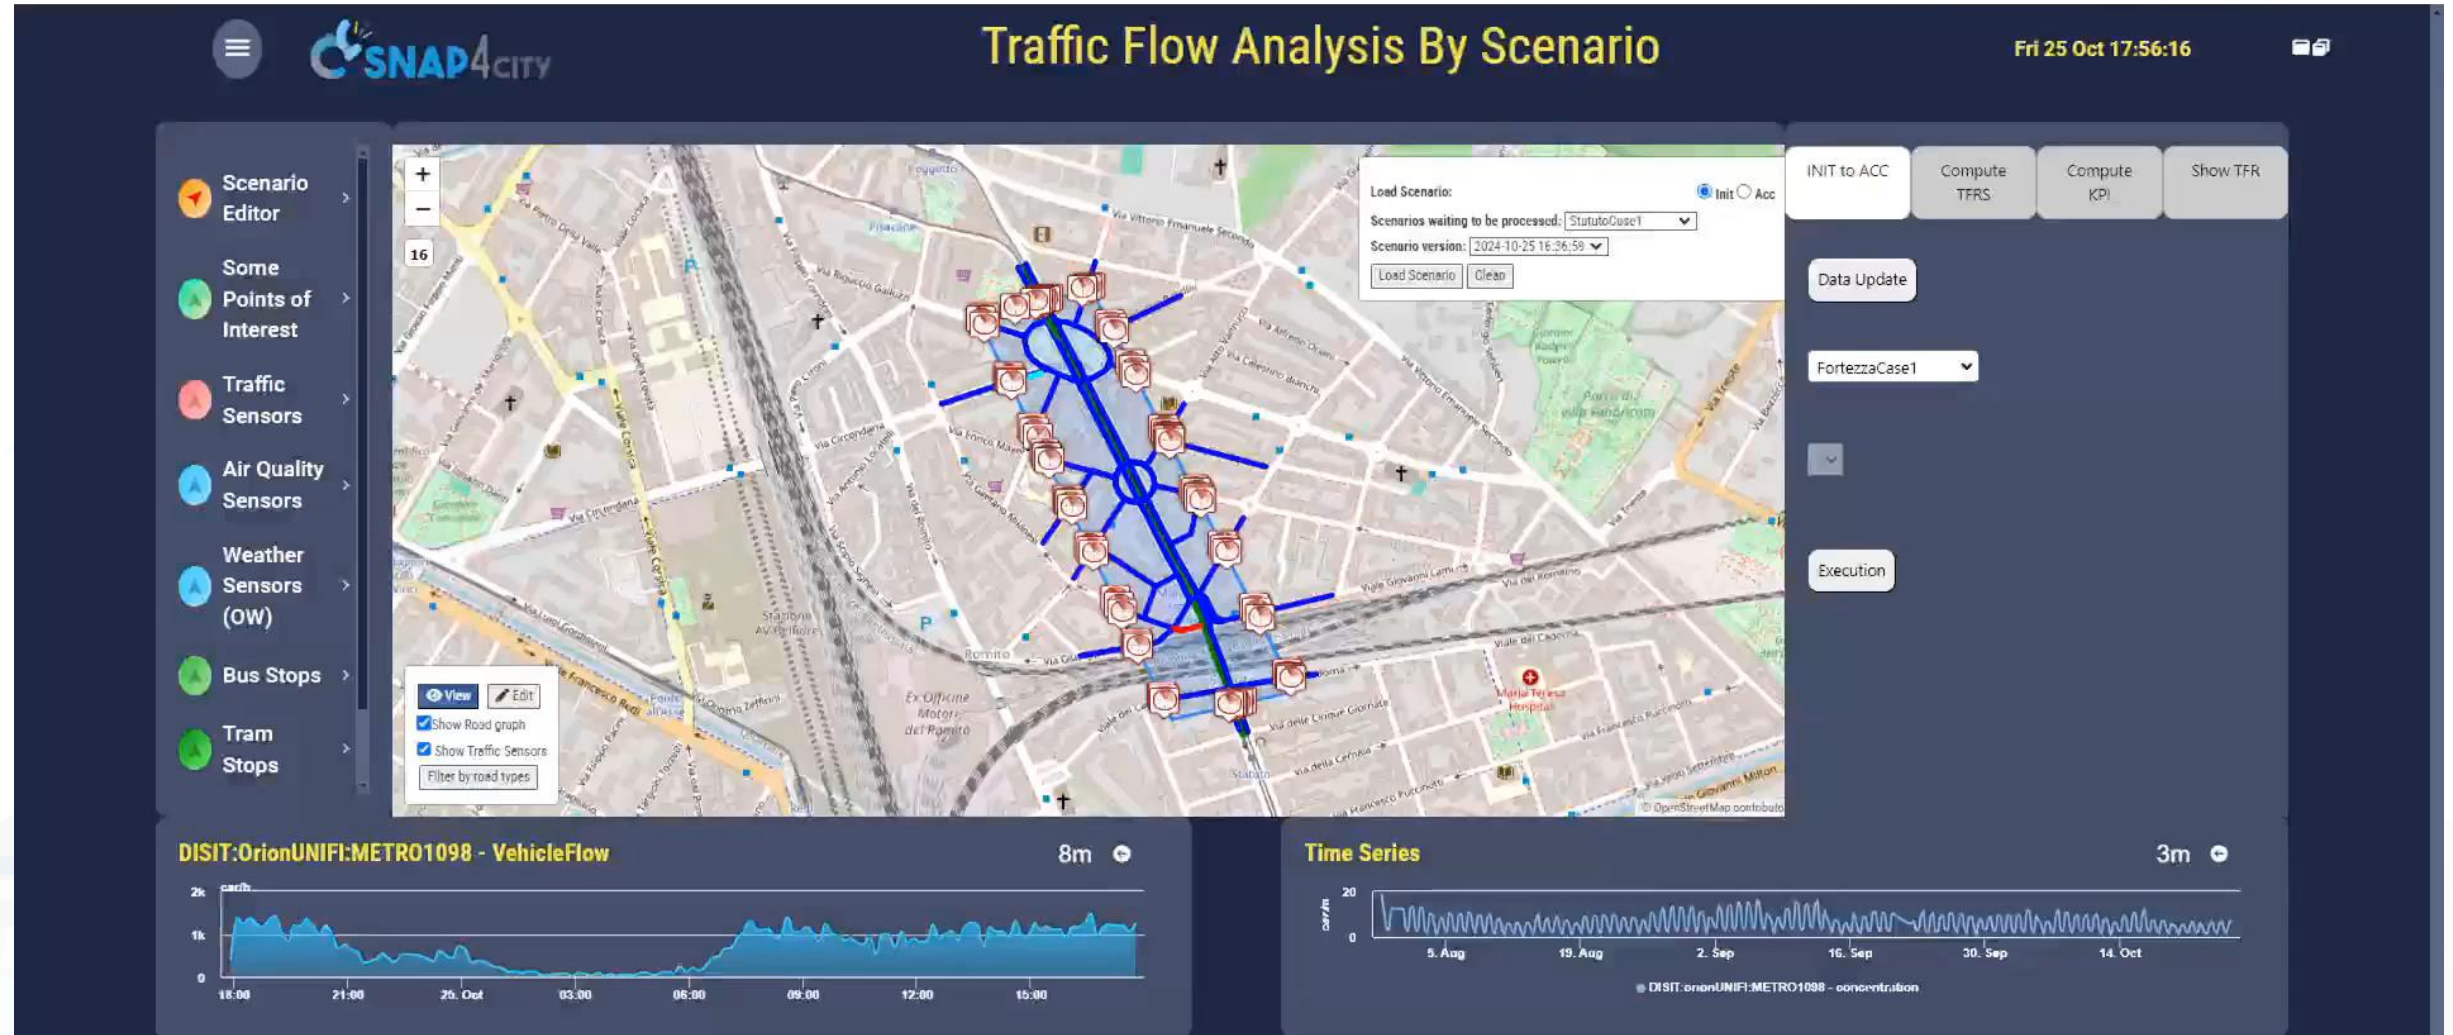

- **Reductions from 5% to 15%**

Conclusions & Future Work

Key Findings

BEFDIT enables scalable, modular, and interoperable simulation ecosystems

- MLOps support for stable and one shot API calls
- API-based interoperability
- Containerized BEXs ("Behavior Execution as a Service")
- Persistent versioned simulation management
- Privacy-aware multi-user collaboration

Future Directions

- More simulators & BEXs
- Smarter AI optimization loops
- Automated multi-domain optimization

Thanks for your attention
