Dashboards and Apps

# Tech Arch

- **Smart Applications can be easily developed exploiting the cloud infrastructure by producing only:**
  - **IoT App** with almost no coding activities
  - **Data Analytics** in Python or Rstudio
  - **Dashboards** with almost no coding activities.
- **→ Orange parts of the previous figure slide are those usually developed,**
  - all the rest, is part of the provided microservices and infrastructure.
- **Third party applications can dialog with the solutions via**
  - **Smart City API**, Swagger: <https://www.km4city.org/swagger/external/>
  - **IoT Brokers**, for example for NGSI Orion Broker:  
<https://www.km4city.org/swagger/external/?urls.primaryName=Orion%20Broker%20K1-K2%20Authentication%20API>
  - **IoT App** any protocols: <https://www.snap4city.org/65> They can also expose some specific API, custom made

# How to adopt Snap4City

## Smart City as a Service

- Supporting Org
- 100% Open Source Platform: Github
- Further developments
- Publishing Appliances and Dockers
- Training courses, docs
- Consulting
- Forums
- Etc.

**Download  
and deploy**

## On your premise

## Installation on your premise

- Virtual Machines or Dockers
- Different configurations
  - From small to scalable
  - Exploiting your legacy tools
  - Interoperable with any tool
- No vendor lock-in, No tech lock-in

## Mixed solutions! For example:

- Start on Cloud as Smart City as a Service
  - Migrate on premise on the fly
- Start on Cloud into a sand box
  - Pass to install on premise what you need

# *Achitectural example*

*Altair  
Chemical (I)*

# Snap4Altair Decision Support supervision and control, Industry 4.0

- **Multiple Domain Data**

- Distributed Control System: energy, flows, storage, chemical data, settings, ..
- Cost of energy, Orders,
- Production Parameters
- Maintenance data

- **Multiple Levels & Decision Makers**

- Optimized planning on chemical model
- Business Intelligence on Maintenance data

- **Historical and Real Time data**

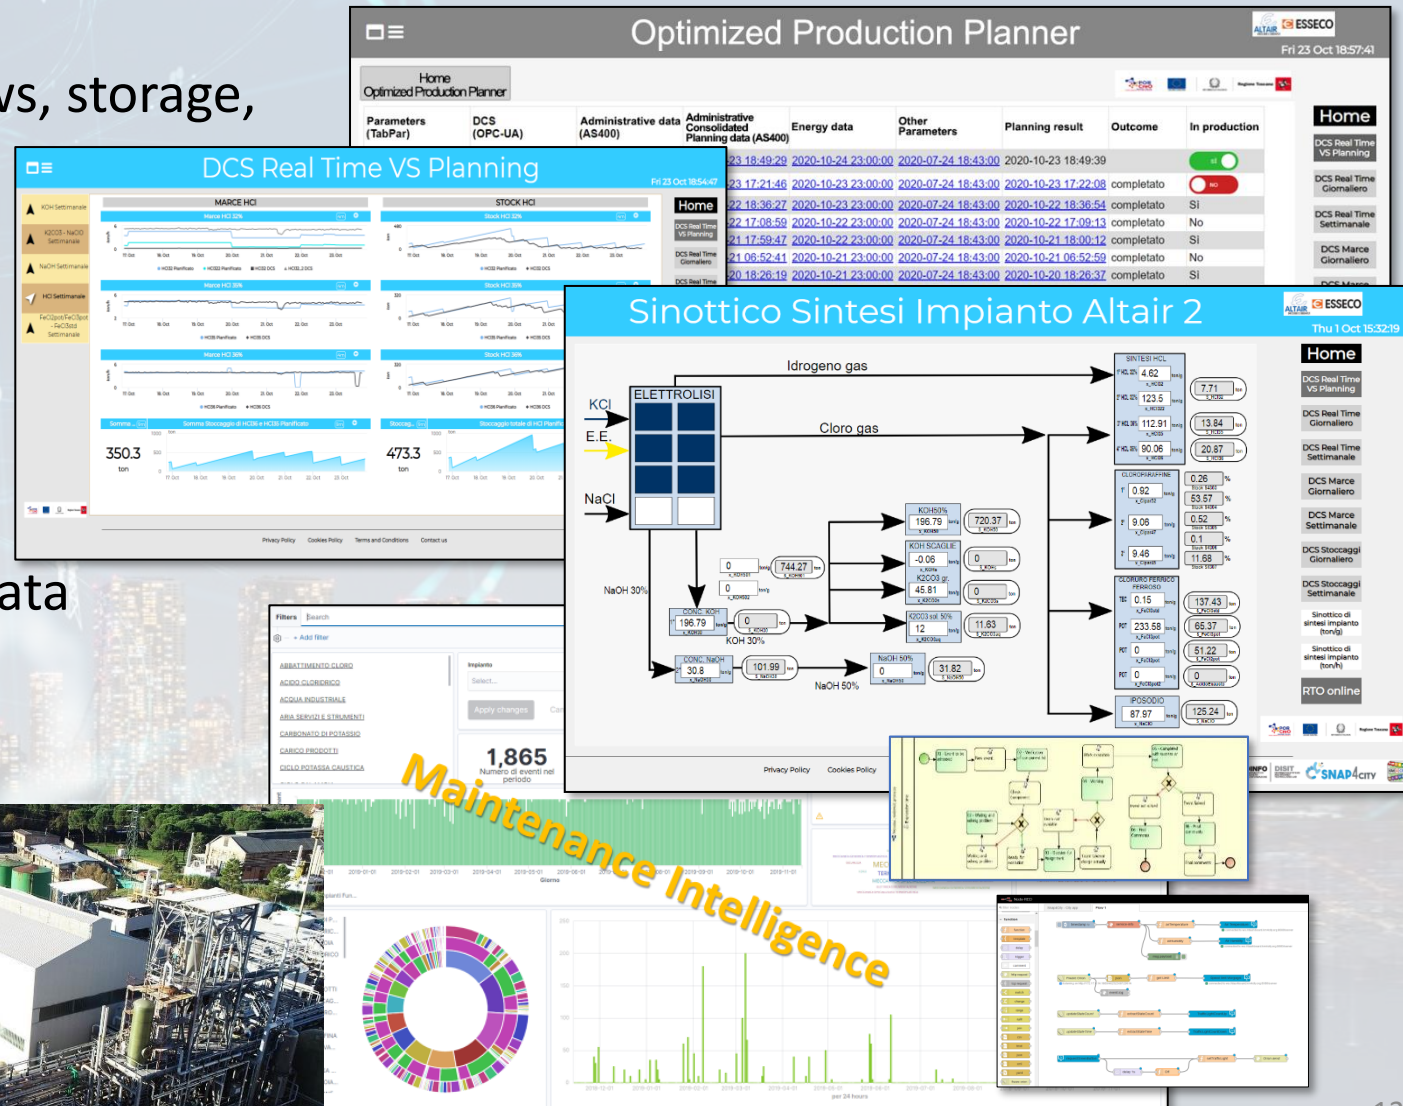

- Billions of Data

- **Services Exploited on:**

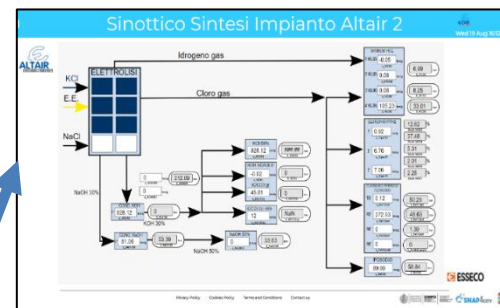

- Multiple Levels, Mobile Apps, API

- **Since 2020**

Snap4City (C), October 2022

Snap4City Innovation Matrix

	Parameters	Commons
Needs		
Current Practices		
Value proposition (current)		
Value proposition (Future)		
Solution		
Value Capture		
Key Partners		
Barriers		

- **Performing workshops:** Innovation Matrix by domain
- **Entity Identification:** which is the **Dictionary**
  - **Data Models** for: User, Operator, Vehicle, Analysis, Server, Client, Mobile App, parking area, etc.
  - **IoT Devices** as: City user XX, Control Room Operator, Doctor Rossi, Cop 3726, Car FI796HG, IoT Device XY, Trip 34, Patient Health Record for Robert, etc.
  - **External API:** to interoperate with any other application and service.
  - **External Services:** to host into the user interface and Dashboards elements coming from third party applications
- **Scenarios** describing the application/task, textual definition, with some standard table as UML. The scenarios have to refer to identified entities.
- **Use Cases** describing the different cases into the single applications, by using UML formalization, there are specific Use Cases for each Scenario. Please focus on the most relevant, those that are adding value to your solutions. The others can be given for granted in a first phase.
- **Requirements** by using standard tables, using identified Dictionary of Entities, prioritizing them, setting mandatory/preferred/optional, functional and non-functional, first/second/third release, etc.
- **Sequence Diagrams:** for some of the critical aspects- For example for describing the user interaction, and/or the interaction among major entities, putting in evidence which is the Entity starting the dialogue with respect to the other entities involved (e.g., a client requesting data to the server, a device sending data to the broker). UML sequence diagrams are a suitable formalization for the purpose.

# *Design and Develop: Data Models & Processes*

<https://www.snap4city.org/download/video/course/iot/>  
<https://www.snap4city.org/download/video/course/di/>

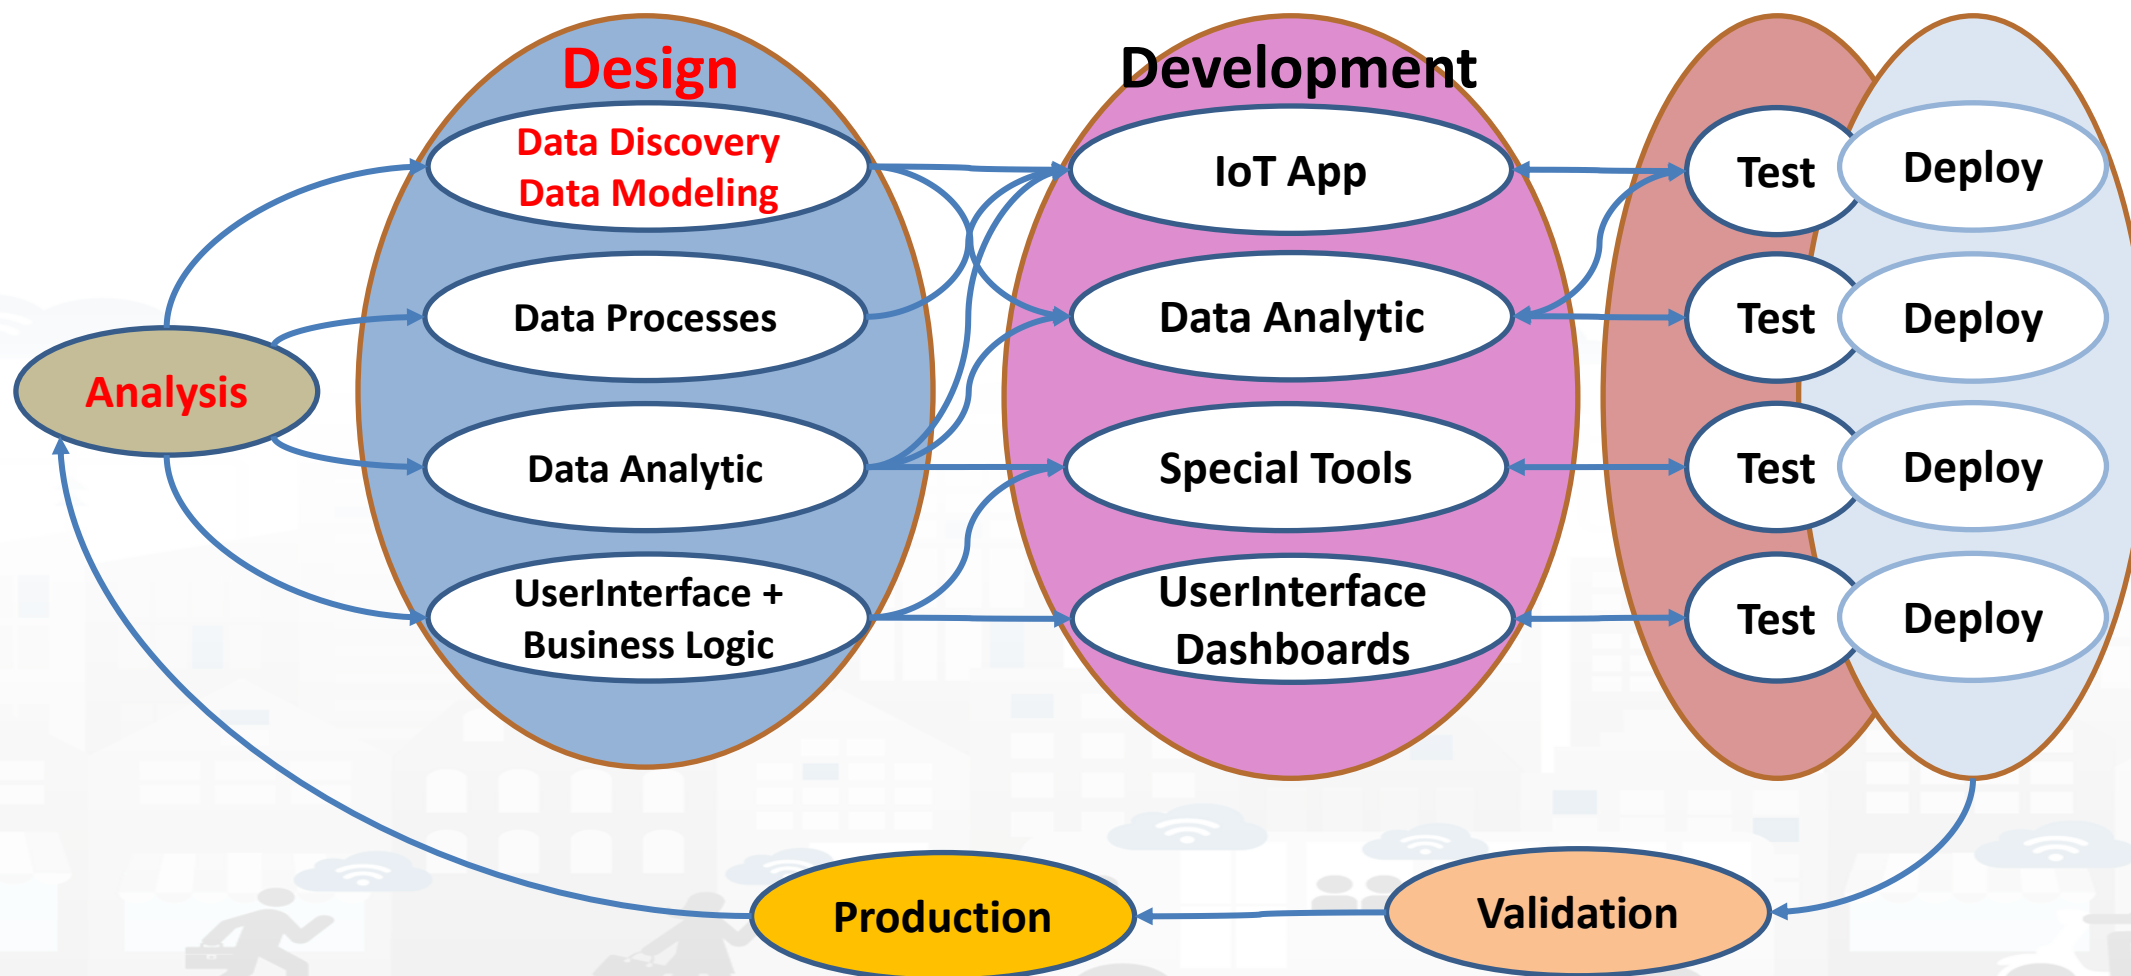

# *Design: Data Discovery*

# Development Life Cycle Smart Solutions

# Data Discovery

- Performed by analyzing data from:
  - I. identified scenarios from the **Snap4City Innovation Matrix**
  - II. main organizations (via interviews)
  - III. other stakeholders (via interview and web pages)
  - IV. regional, national and international sources:
    - I. open data portals, weather sources,
    - II. IOT networks, etc. via web pages and sites
  - V. Mobile Applications (via Snap4City API)
  - VI. Snap4City portal <https://www.snap4city.org>
  - VII. etc.
- Exploiting Snap4City experience, data and tools
- By following the Snap4City guidelines on Data Search on web and world reported in the training course and on Snap4City.org portal.

# *Design: from Data Modeling to Data Ingestion*

IOT Device

# What About IoT Devices, Time Series

IOT Device

Sends a  
message

Message (  
timestamp: 02-04-2020 at 10:30,  
Temperature: 29.34,  
Humidity: 35  
)

dateObserved	Temp	Humidity
02-04-2020 10:30	34.5	23
02-04-2020 10:40	36.5	24
02-04-2020 10:50	36.0	22.5

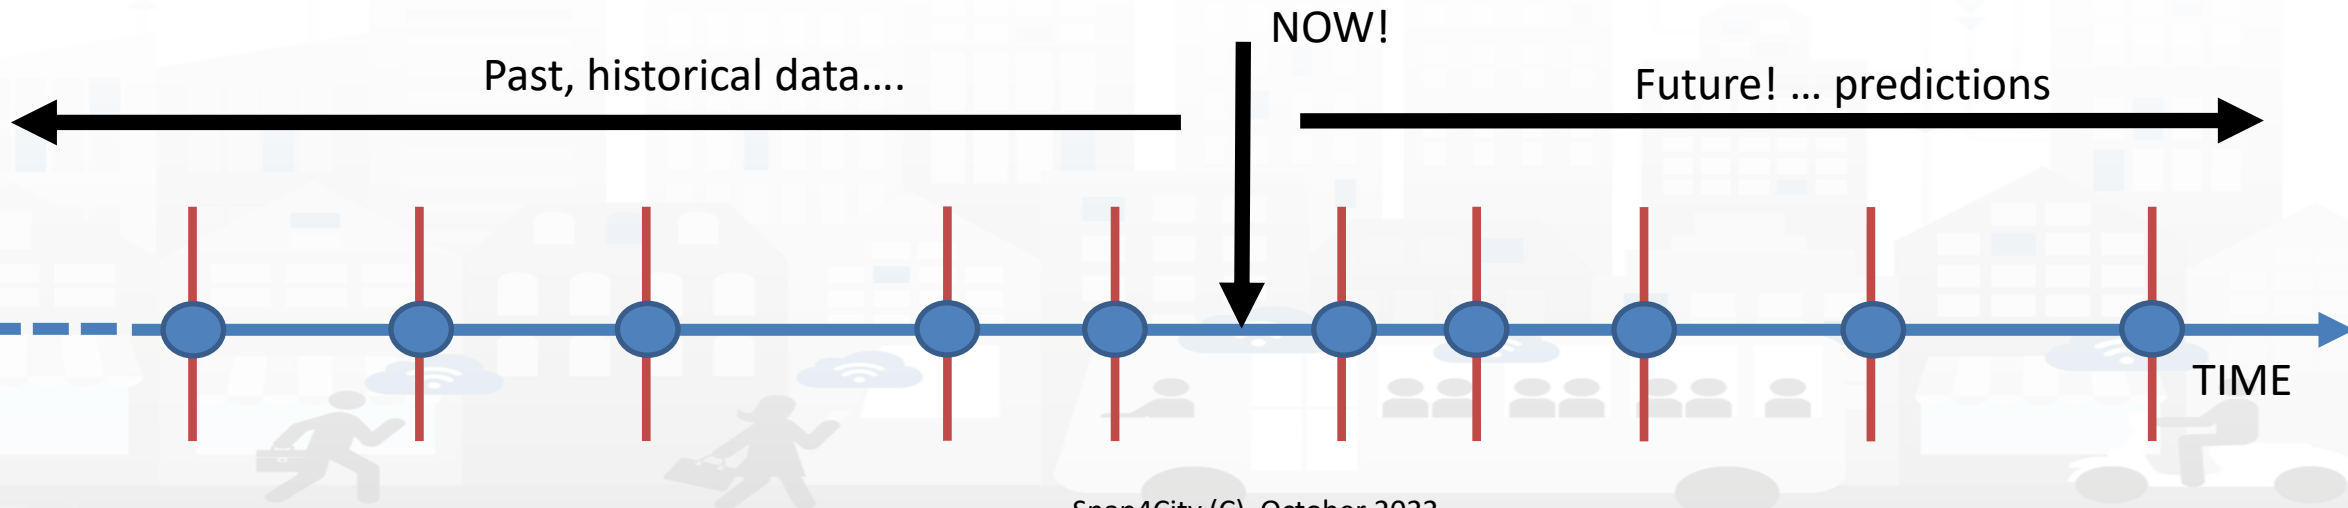

- A set of data coming from an IoT Device with multiple sensor become a time series of values for devices.
  - For example: taking a new measure every 10 minutes (**Red Lines**)
  - Non regular rates can be valid data as well.
- Each new measure in Snap4City is conventionally time located in «**dateObserved**», which has to be **Unique**.
  - **Only one message per dateObserved is allowed**

# Time Series: they are data streams

- As soon as you have registered an IoT Device
  - You are ready to get Future data, may be arriving in PUSH
  - Recall and store historical data as well, but they have to be
    - recalled in PULL with some IoT App.
    - Loaded in PULL with some File or Data Table Loader

# IoT Devices

IoT Device Models

IoT Device

- Name:.....
- Model:.....
- Position: .....

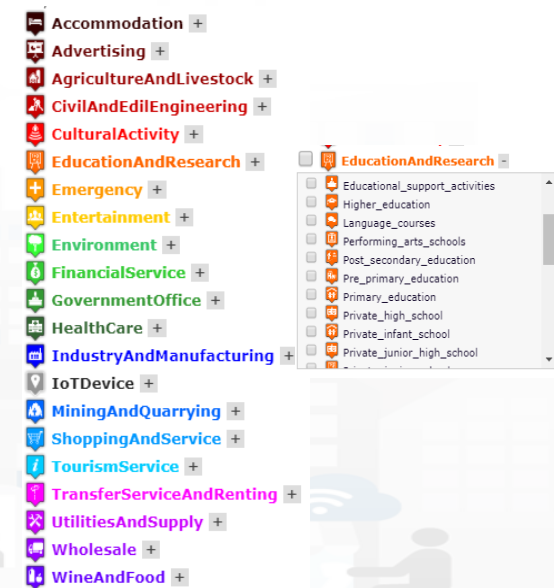

## IoT Device Variables

- **dateObserved:** .....
- ID:
- Status: ready
- Temperature: 70%
- WaterLevel: 35%
- UsedCapsBox: 30%
- Power: OK
- .....

- Conceptually are IoT Devices with sensors/actuators, IN/IN-OUT
- They are classified in terms of nature/subnature
- For Searching and showing on maps and dashboards  
**HLT of IoT Devices** can be:

- **IoT Device Models**, for example: «personal coffee machine»
- **IoT Device** name, for example: «mycoffemachine1», «CM23»
- **IoT Device Variable**, for example: «Temperature»

Mobile Device Models

Mobile Device

- Name:.....
- Model:.....
- Spec:...

## Mobile Device Variables

- ID:
- **dateObserved: .....**
- Status: ready
- Temperature: 70%
- Gasoline: 35%
- Velocity: 231,3 Km/h
- **Position: 44.3223, 11.3432**
- .....

- They are a special case of IoT Devices
  - they are managed as IoT Devices in the system
- They are classified in terms of nature/subnature
- For Searching and showing on maps and dashboards, they are different

## HLT of Mobile Devices can be:

- **Mobile Device Model**, for example: «sedan»
- **Mobile Device name**, for example: «BMW JD7356HD», «Ford KO786KK»
- **Mobile Device Variable**, for example: «velocity»

# IOT Device Model (3): Attributes

Where	IOT Device Model	IOT Device	A Temporal Instance
IOT Broker	Broker: <b>OrionUNIFI</b>		
IOT Broker	Protocol: <b>NGSI</b>		
Info	ID: string	ID: " <b>park45</b> "	<b>park45</b>
Position	GPS: lat, long	GSP Position: <b>43.12, 11.34</b>	GSP Position: 44.12, 11.12
Static attribute	Description: string	Description: " <b>parking massaia</b> "	
Static attribute	Location: string	Location: " <b>Via Massaia</b> "	
Static attribute	Civic Number: string	Civic Number: <b>3</b>	
Static attribute	MaxCapacity: number, cars	MaxCapacity: <b>456</b>	
Values	dateObserved: Timestamp		<b>23-12-2019T20:13:12...</b>
Values	FreeSlots: Integer, #		<b>345</b>
Values	Humidity: float, %		<b>25,5</b>
Values	Temperature: float, celsius		<b>34</b>

# Model meaning

- **ID:** is the unique identifier for reconnecting Temporal Instances with registered IOT Devices
- **Static Attributes:**
  - Are typically associated with instances of the IOT Device.  
E.g.:, You have a set of parking areas, each of them is located in a specific street, and has its one name, etc.
  - Different kinds of attributes can be set for each SubNature. Their definition has to be prepared into the Knowledge Base 😊 for automated indexing.
- **Values:** they are time varying variables (temporal values/instances)
  - They change over time, the timestamp of the time series is conventionally «dateObserved» in Snap4City
  - In new *SensorMobile* HLT, also GPS can be changing over time as in the MyKPI
- **NOTE for:**
  - **names/IDs:** Spaces or strange characters are not allowed in the. Please use simple alphanumeric strings, it is a limitation of many solutions including Orion Broker and increase interoperability of your data.
  - **Values of attributes and variables:** can be UTF8, but similarly, they do not accept: () <> “ ‘ ; = into values
  - [https://fiware-orion.readthedocs.io/en/master/user/forbidden\\_characters/index.html](https://fiware-orion.readthedocs.io/en/master/user/forbidden_characters/index.html)

# Using the IOT Device Model notes!!!

- Once performed the **IOT Device Model**, a number of IOT Devices can be produce **using the model as a Template**
  - **NOTE:** the produced IOT Devices are not going to change if the IOT Device Model is modified.
  - *Your biscuit is not changing if the template is modified after the printout*

# *Custom Data Modeling example*

# Example 1

## IoT Device Model: Driver

**Nature:**.....

**Subnature:** .....

**Lat,lon:** Default (they do not need to be specified in the variables, they are provided by default, but values have to be imposed at the instantiation of the device from model), they are float

**Device in Mobility:** No (the variable do not need to be specified, while the value has to be set to state if the Lat,Lon are going to change, moving the device or not)

Value_name	Value Type	Value Unit	Data Type
<b>dateObserved</b>	<b>Timestamp</b>	<b>Timestamp in ms</b>	<b>String</b>
identifier	ID	text	String
name	entity	text	String
surname	entity	text	String
age	age	number	Integer

status	status	some coded status	String
vehicle	Identifier	ServiceURI	String

# Example of Data Model Diagram

TOP

## *Design & Develop: Data Processes*

<https://www.snap4city.org/download/video/course/di/>

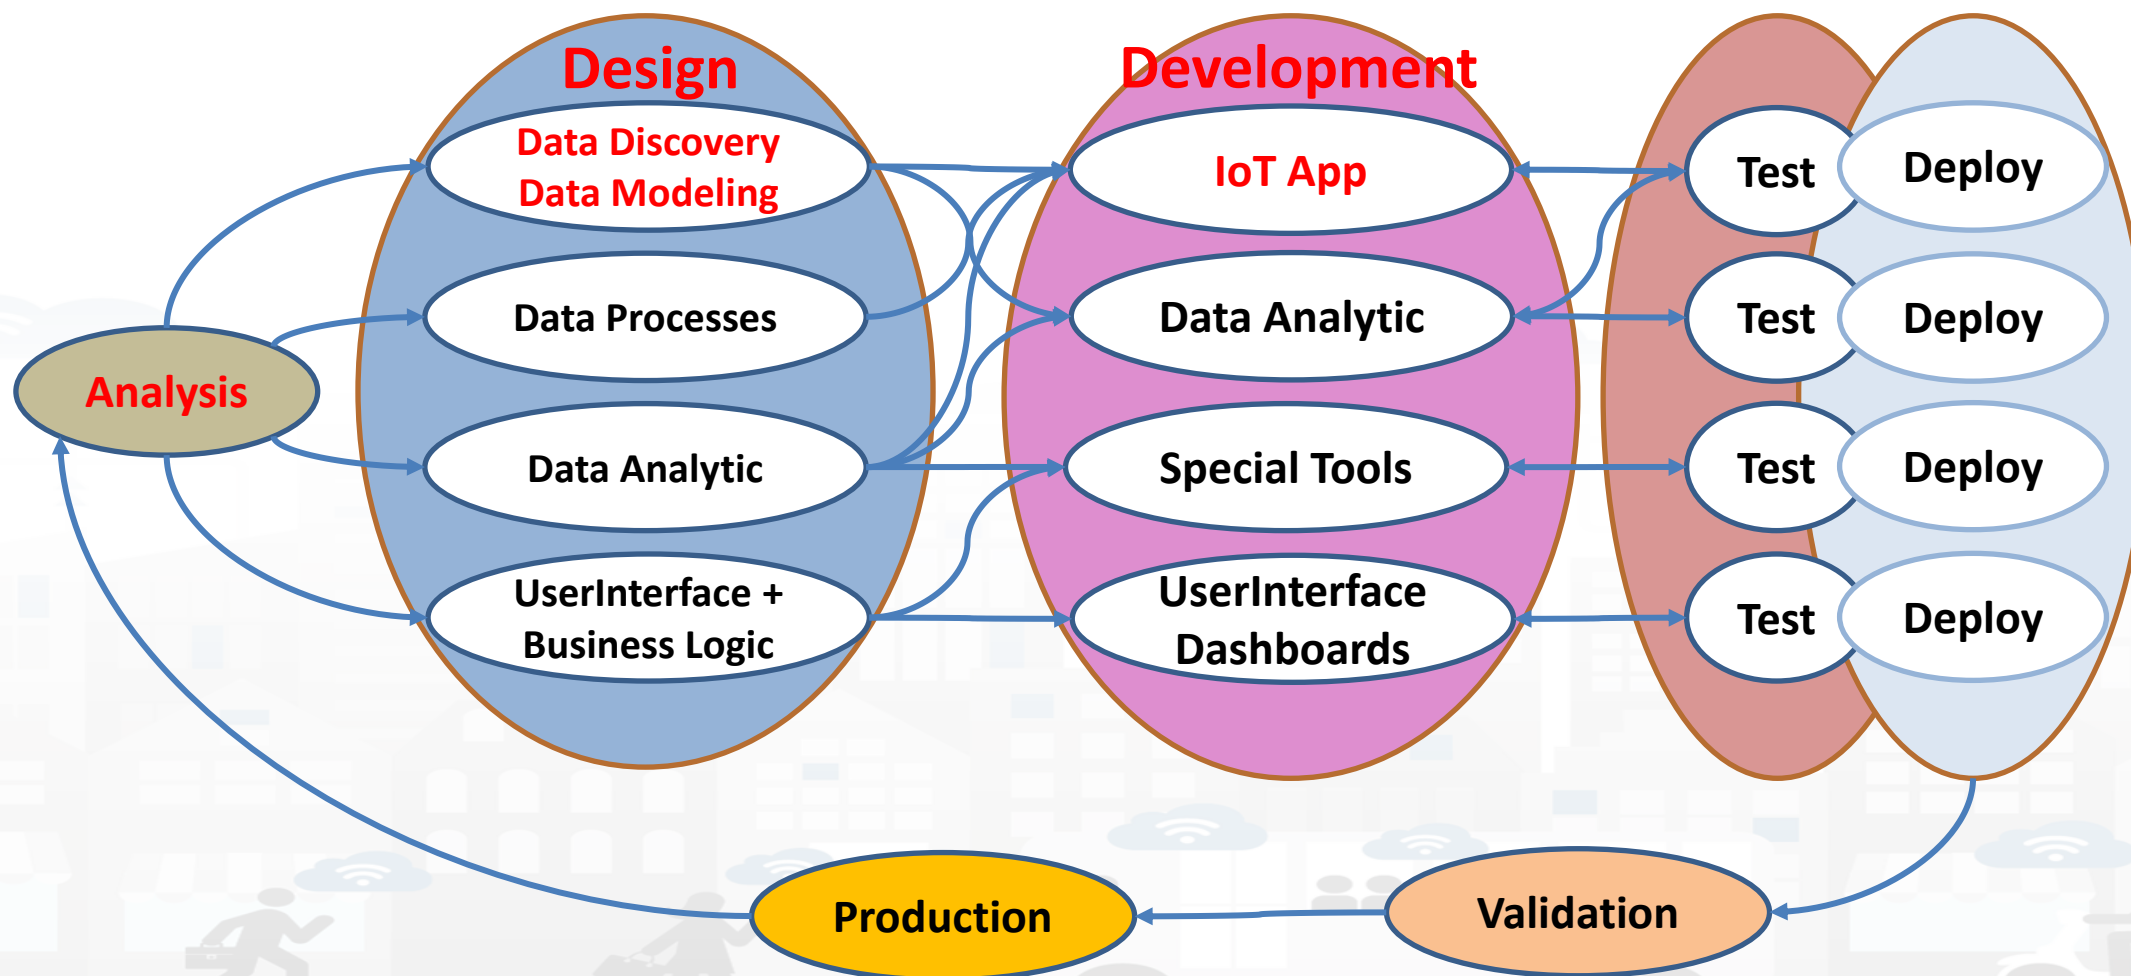

# Activities for IoT App data processes

- **Data Ingestion, gathering, harvesting, grabbing**
- **Data Transformation, transcoding, decoding, converting**
- **Data load to storage, retrieve from storage**
  - the load is typically performed loading data on some Internal IoT Orion Broker V2, or on some MyKPI storage
  - the retrieval is typically performed using one of the several query / search nodes.
  - Many other kind of storage connections are accessible in Snap4City IoT App
- **Data Production, generation, reformatting, etc.**
- **Data Publication, post in other channels of any kind, etc.**

# Development Life Cycle Smart Solutions

# *Design: Data Processes*

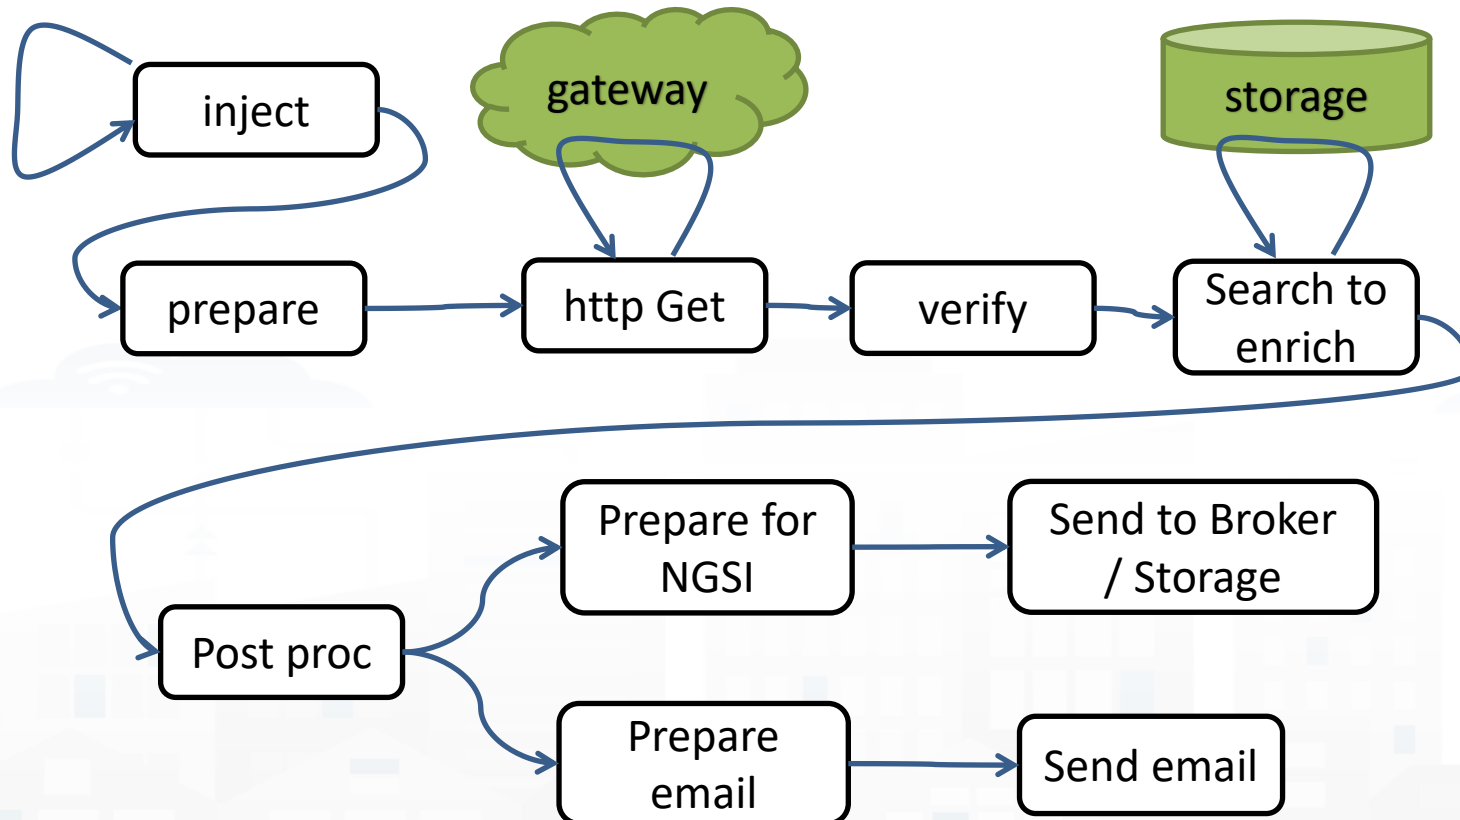

# How to Design

1. Business Logic is going to be implemented in IoT App, with a set of flows.
2. Decompose you problem and sequence diagram in single Data/event Flows, from client side and server side.
3. Identify the single Data/Event Flow, as those that start from a certain event (periodic or provoked from other messages), and that finish with: sending of data in the storage, change status, send an event, provide a message into a dashboard, send an email, etc.
4. Design the single Data/Event Flows with a mixt of possible **activities**.
  1. The design can be performed using data flow diagrams.
  2. It can have sequences, switch, serialization, packing, joining, distribution, communication, transformation, search, etc.
5. When the design of Data/Event Flow mechanism is clear the designers can pass to directly sketch the flow in Node-RED which is a visual programming.
6. Incrementally improve the IoT App Node-RED flows by adding nodes needed
7. Once obtained the IoT App Node-RED flows in the correct data model you can send data to the ingestion broker, but also perform many other actions on several services.

# IoT App Design, for each Data/Event Flow

- Periodically activate the flow
- Call a gateway to get data
- Verify the correctness of data
- Enrich the data with other information coming from Cloud data into the storage
- Transform the data in the correct forma
- Send the data into the IoT Broker, and thus send the data in the storage on a specific IoT Device
- Send also a notification via email

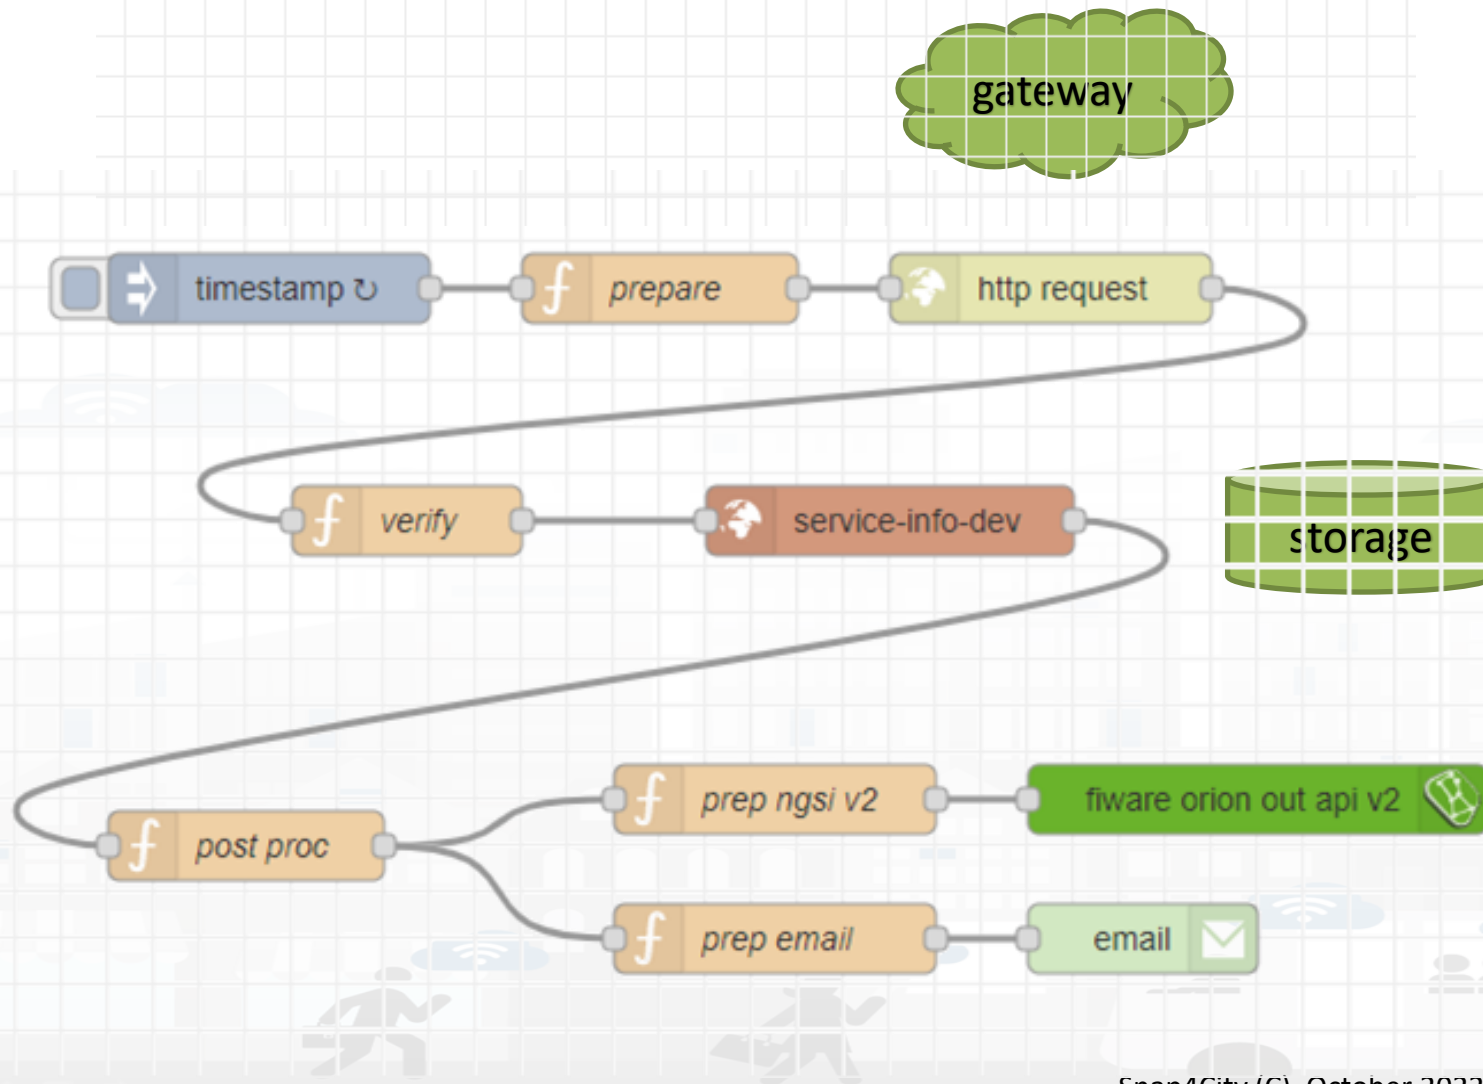

TOP

# *Develop: Data Processes*

# IoT App Design, for each Data/Event Flow

- Periodically activate the flow
- Call a gateway to get data
- Verify the correctness of data
- Enrich the data with other information coming from Cloud data into the storage
- Transform the data in the correct forma
- Send the data into the IoT Broker, and thus send the data in the storage on a specific IoT Device
- Send also a notification via email

***Implicit services are not drawn***

# A sample of Data Ingestion

Function, example of NGSI V2 payload:

```
var time_now = new Date().toISOString();
var arandvalue = Math.random()
msg.payload =
```

```
{
  "id": "mydev",
  "type": "mydevSensor",
  "anID": { "type": "integer", "value": "http://www.disit.org/km4city/resource/iot/...../anuser" },
  "VDDValue": { "type": "float", "value": arandvalue },
  "dateObserved": { "type": "string", "value": time_now },
  "latitude": { "type": "float", "value": "28.61810" },
  "longitude": { "type": "float", "value": "11.34300" },
  "status": { "type": "integer", "value": 34 }
}
```

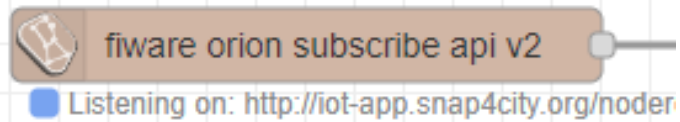

```
return msg;
```

Posted data on IoT Brokers  
**green nodes** are automatically  
saved into the data Storage

```
// it is a time serie
// it may move over time
// it may move over time
```

# Read and share Data and Context Data

1) Event driven from Broker, read last context data. It is not sure that this change is on Storage

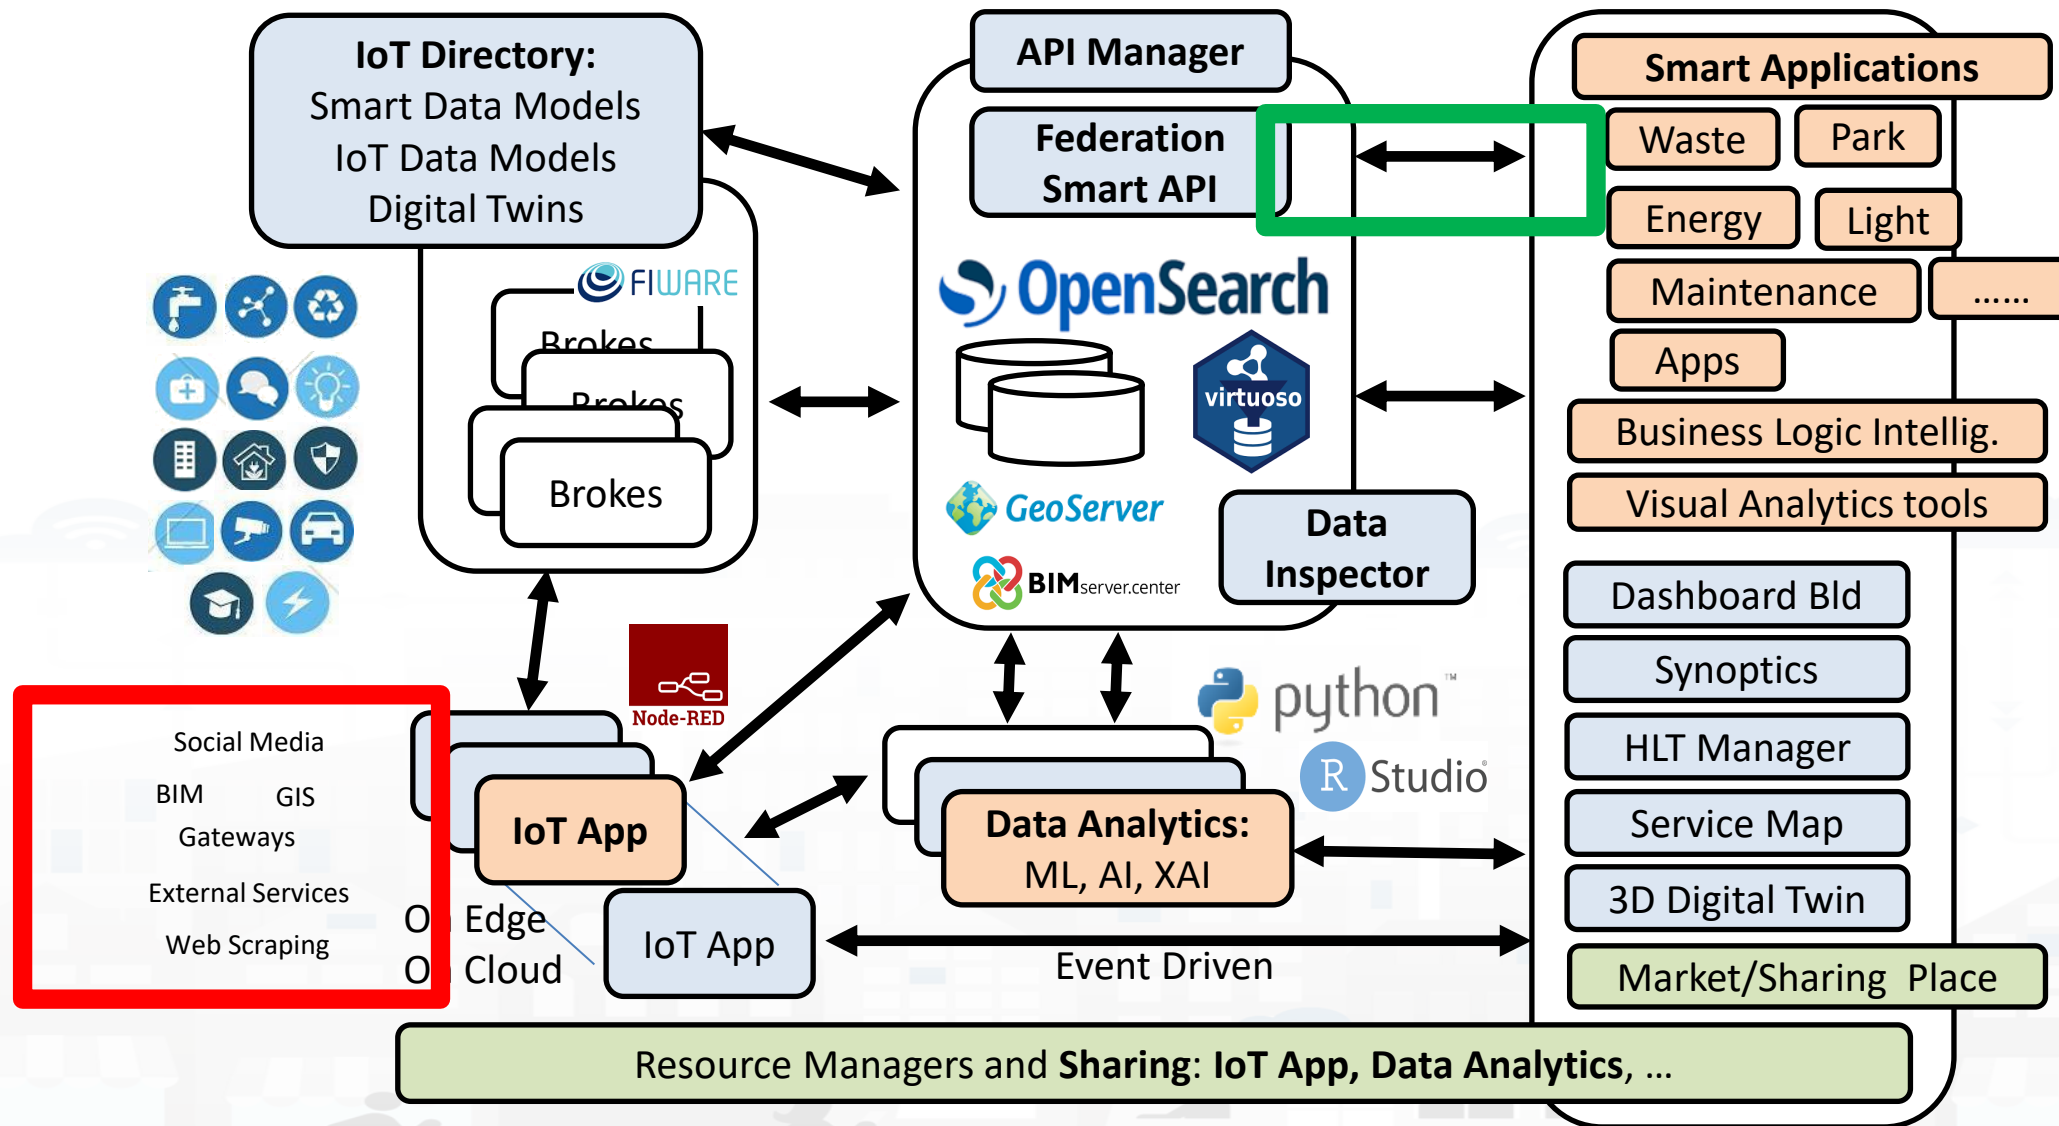

2) Recollect data from Storage

- This node uses the Smart City API
- **Any External Application** can get the same data in authenticated authorized manner via Smart City API
- Smart City API is a better approach instead of producing a file outside or providing data via some local API service created from IoT Application (feasible but not protected)

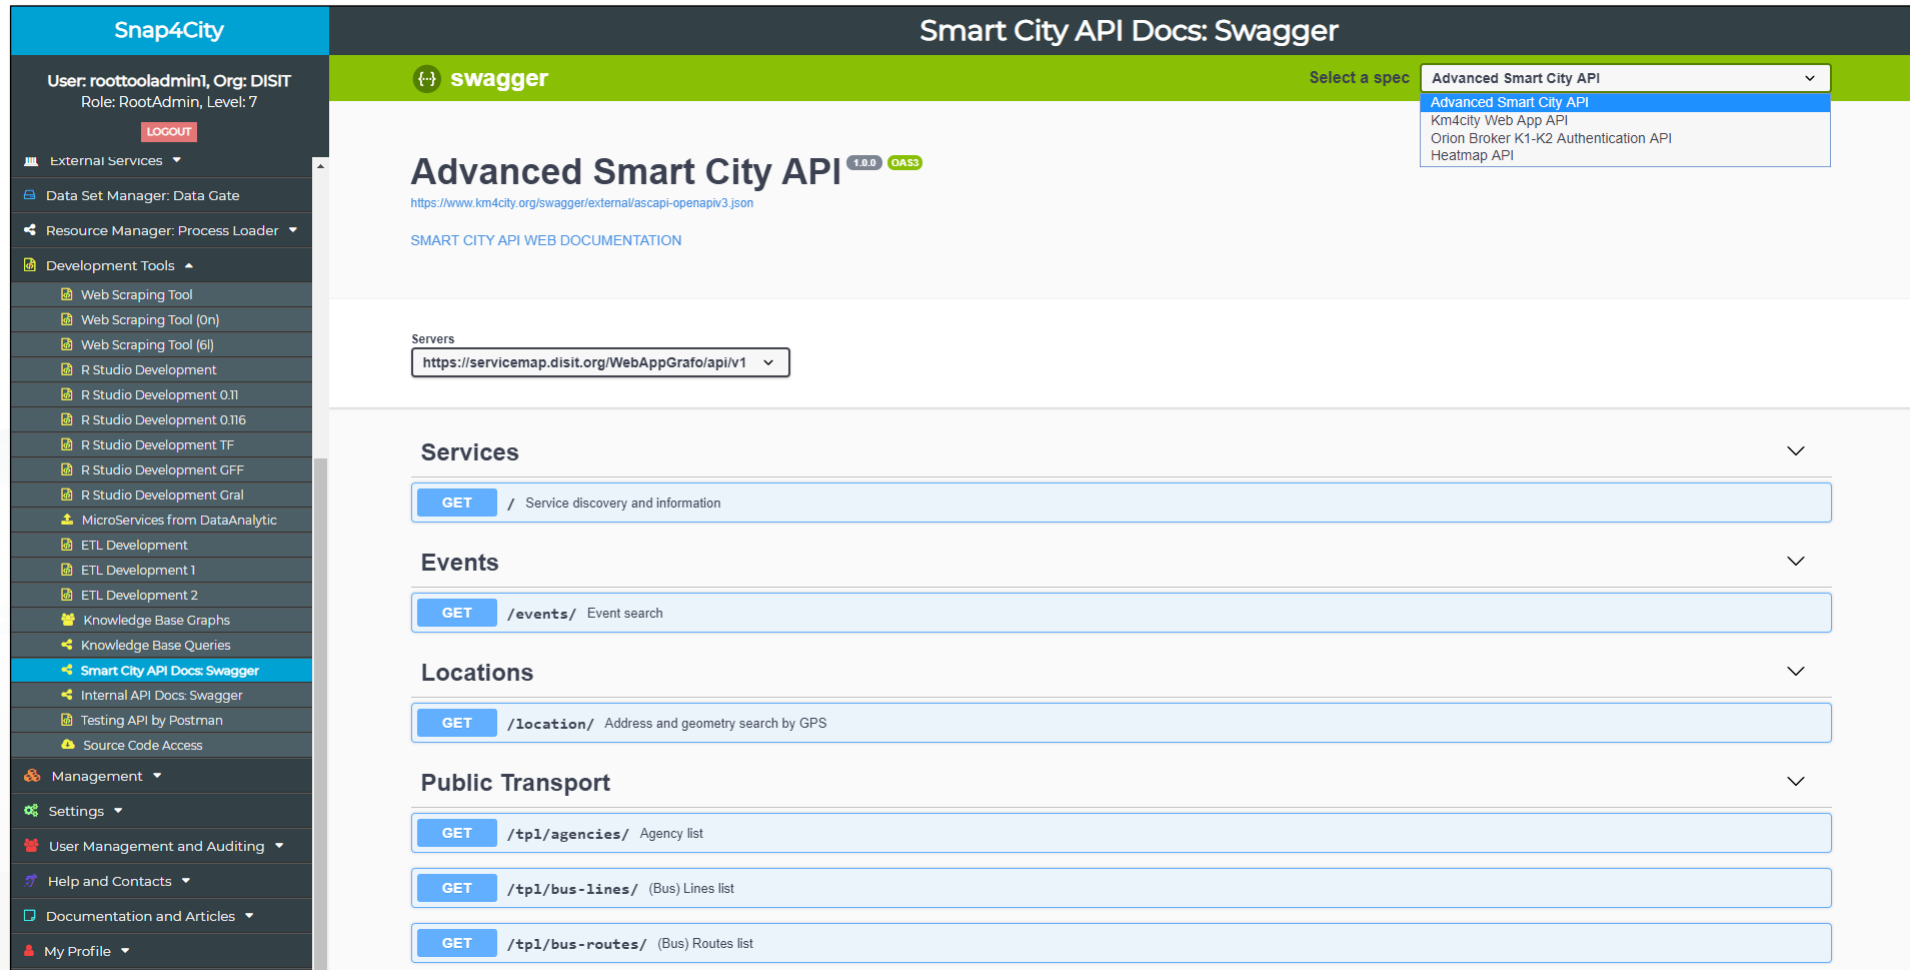

# Tech Arch

# External Smart City API

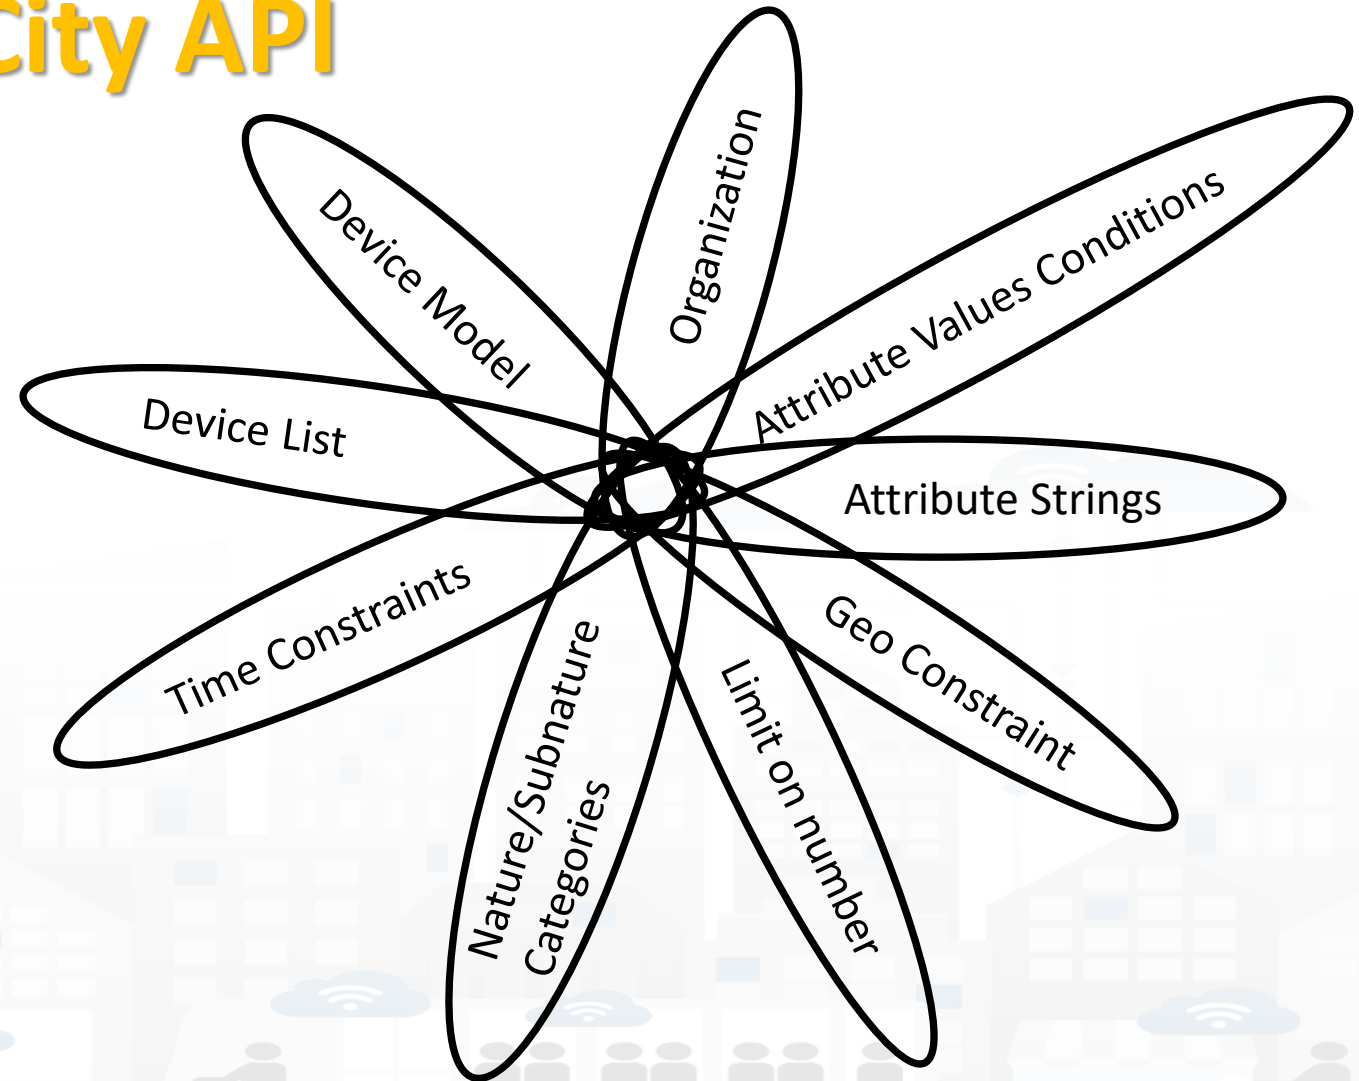

The screenshot displays the Snap4City Smart City API Docs: Swagger interface. On the left is a sidebar menu with the Snap4City logo at the top. Below the logo, it shows user information: 'User: roottooladmin1, Org: DISIT' and 'Role: RootAdmin, Level: 7', along with a 'LOGOUT' button. The menu is organized into several sections: 'External Services' (Data Set Manager, Resource Manager), 'Development Tools' (Web Scraping Tool, R Studio Development, ETL Development, Knowledge Base), 'Smart City API Docs: Swagger' (highlighted), 'Internal API Docs: Swagger', 'Testing API by Postman', 'Source Code Access', 'Management', 'Settings', 'User Management and Auditing', 'Help and Contacts', 'Documentation and Articles', and 'My Profile'. The main content area is titled 'Smart City API Docs: Swagger' and features a 'swagger' tab. A dropdown menu 'Select a spec' is open, showing options: 'Advanced Smart City API' (selected), 'Advanced Smart City API', 'Km4city Web App API', 'Orion Broker K1-K2 Authentication API', and 'Heatmap API'. Below this, the 'Advanced Smart City API' section is displayed with a version '1.0.0' and a 'OAS3' badge. It includes a URL 'https://www.km4city.org/swagger/external/ascapi-openapi3.json' and a link to 'SMART CITY API WEB DOCUMENTATION'. A 'Servers' dropdown is set to 'https://servicemap.disit.org/WebAppGrafo/api/v1'. The interface lists several API endpoints under different categories: 'Services' (GET / Service discovery and information), 'Events' (GET /events/ Event search), 'Locations' (GET /location/ Address and geometry search by GPS), and 'Public Transport' (GET /tp1/agencies/ Agency list, GET /tp1/bus-lines/ (Bus) Lines list, GET /tp1/bus-routes/ (Bus) Routes list).

<https://www.km4city.org/swagger/external/index.html>

# Selection on Smart City API

- Combining different filters for selecting entities from Smart City APIs
- ***Be care***: some of the combinations may lead to empty result

# How to Get the «Query» used in More Options (2a)

- **REST CALL by category → JSON (Options in RED), they are REST ASCAPI calls**
  - **Requesting a category, so that to see all Services of the same category (subNature)**
    - [http://svealand.snap4city.org/ServiceMap/api/v1/?selection=59.581458578537955;16.71183586120606;59.62875017053684;16.875171661376957&categories=Street\\_light&maxResults=100&format=json](http://svealand.snap4city.org/ServiceMap/api/v1/?selection=59.581458578537955;16.71183586120606;59.62875017053684;16.875171661376957&categories=Street_light&maxResults=100&format=json)
      - Please note that in the MoreOption dashboard the GPS area is neglected
    - [https://servicemap.disit.org/WebAppGrafo/api/v1/?selection=43.64471;11.005751;43.89471;11.505751&categories=Green\\_areas&maxResults=200&format=json](https://servicemap.disit.org/WebAppGrafo/api/v1/?selection=43.64471;11.005751;43.89471;11.505751&categories=Green_areas&maxResults=200&format=json)
      - Please note that in the MoreOption dashboard the GPS area is neglected
    - Custom PINS note: “selection” coordinates are used for collecting attributes in custom PINS. Other options such as “maxDists” cannot be used in custom PIN. All parameters can be used in other cases.
    - Different KB links are identified by their ASCAPI links: [svealand.snap4city.org](http://svealand.snap4city.org), [servicemap.disit.org](http://servicemap.disit.org), ....
  - **Requests to SuperServiceMap for the network of Federated KBs by using /api/.....**

Without prefixed KB to obtain merged results from more KBs. For example as:

    - [/api/v1/?categories=Air\\_quality\\_monitoring\\_station&format=json](/api/v1/?categories=Air_quality_monitoring_station&format=json)
    - Please note that the direct links to the superservicemap can be of the form:
      - <https://www.disit.org/superservicemap/api/v1/> .....

# How to Get the «Query» used in More Options (2b)

- **REST CALL by ServiceURI → JSON (ServiceURI in RED), they are ASCAPI calls**
  - **Requesting single Service**
    - [https://servicemap.disit.org/WebAppGrafo/api/v1/?serviceUri=http://www.disit.org/km4city/resource/ARPAT\\_QA\\_FI-BOBOLI&format=json](https://servicemap.disit.org/WebAppGrafo/api/v1/?serviceUri=http://www.disit.org/km4city/resource/ARPAT_QA_FI-BOBOLI&format=json)
    - [https://servicemap.disit.org/WebAppGrafo/api/v1/?serviceUri=http://www.disit.org/km4city/resource/ARPAT\\_QA\\_FI-MOSSE\\_SV&format=json](https://servicemap.disit.org/WebAppGrafo/api/v1/?serviceUri=http://www.disit.org/km4city/resource/ARPAT_QA_FI-MOSSE_SV&format=json)
    - Different KBs links are identified by their ASCAPI links: [svealand.snap4city.org](http://svealand.snap4city.org), [servicemap.disit.org](http://servicemap.disit.org),
  - **Requesting all IoT Devices that have been produced by the same Model**
    - <https://www.disit.org/superservicemap/api/v1?selection=59.36535064975547;13.457822799682619;59.39031474260852;13.566999435424806&model=SmartLightCapelon&format=json>
      - Please note that in this case the call is performed on the superservicemap, you can change to go directly on the right KB
      - You can specify both category and model to be more precise and focused.
    - [https://www.disit.org/superservicemap/api/v1/?selection=36.8092847020594;12.216796875000002;42.71473218539458;32.03613281250001&categories=Travel\\_information&format=json&fullCount=false&maxResults=500&model=DOMESTIC\\_MOVEMENTS2013-2018\\_1620304406](https://www.disit.org/superservicemap/api/v1/?selection=36.8092847020594;12.216796875000002;42.71473218539458;32.03613281250001&categories=Travel_information&format=json&fullCount=false&maxResults=500&model=DOMESTIC_MOVEMENTS2013-2018_1620304406)
      - In this case, we have a double filtering for model and for categories, plus other constraints
      - Please note that in the MoreOption dashboard the GPS area is neglected

## How to Get the «Query» used in More Options (2c)

- Requesting get data single device (view on map, if format HTML and not JSON)

Request to see the single device:

- <https://svealand.snap4city.org/ServiceMap/api/v1/?serviceUri=http://www.disit.org/km4city/resource/iot/orionCAPELON-UNIFI/CAPELON/5C0272FFFE894AF7&format=json&fromTime=3-day>
- With ServerURI: <http://www.disit.org/km4city/resource/iot/orionCAPELON-UNIFI/CAPELON/5C0272FFFE894AF7>
- From KB: <https://svealand.snap4city.org>

<https://svealand.snap4city.org/ServiceMap/api/v1/?serviceUri=http://www.disit.org/km4city/resource/iot/orionCAPELON-UNIFI/CAPELON/5C0272FFFE894AF7&format=json&fromTime=3-day>

# Basic Node.js Blocks on NodeRed on our Advanced IOT Apps

The screenshot displays the Node-RED block palette with the following categories and blocks:

- common**: inject, debug, complete, catch, status, link in, link out, comment.
- function**: function, switch, change, range, template, delay, trigger, exec, zip, md5, soap request, string, xml converter, random, rbe.
- network**: mqtt in, mqtt out, http in, http response, http request, websocket in, websocket out, tcp in, tcp out, tcp request, udp in, udp out, amqp in, amqp2 in, stomp in, amqp out, amqp2 out, stomp out.
- sequence**: split, join, sort, batch, parser (csv, html, json, xml, yaml, base64, msgpack), storage (file, file in, watch, ftp in, mysql, tail).
- social**: email, twitter in, email, twitter out, advanced (feedparser), NGSI (NGSI Entity, NGSI v2ToLD), lwm2m (lwm2m client in, lwm2m client out), location (turf, worldmap, worldmap in, tracks, convex hull), time (sunrise).
- dashboard**: button, dropdown, switch, slider, numeric, text input, date picker, colour picker, form, text, gauge, chart, audio out, notification, ui control, template.

+ on IOT Edge Raspberry

The screenshot displays the Node-RED block palette with the following categories and blocks:

- social**: e mail, twitter, irc, e mail, twitter, irc, google plus, google places, google calendar.
- storage**: tail, file, mongodb, file, mongodb.
- Raspberry Pi**: rpi gpio, rpi gpio, rpi mouse, rpi keyboard, camerapi takephoto, rpi dht22, imagecapture, ledborg, Sense HAT, Sense HAT.
- network**: ping.

# Node-RED Basic Blocks

It is provided with a **minimum** set of functionalities (the building blocks/nodes) while other blocks can be easily added loading them from a **large library** made available by the **JS Foundation**.

Despite to its diffusion, for the usage in the context of Smart City it was **not powerful** to cope with the **basic requirements** of the domain.

The classical nodes provided in the standard version can be classified as: input, output, function, social, storage, analysis, advanced, and dashboard.

**Basic Node.js Blocks on NodeRed on our Advanced IOT Apps**

**+ on IOT Edge Raspberry**

Categories shown in the main interface:

- common**: inject, debug, complete, catch, status, link in, link out, comment
- function**: function, switch, change, range, template, delay, trigger, exec, zip, md5, soap request, string, xml converter, random, rbe
- network**: mqtt in, mqtt out, http in, http response, http request, websocket in, websocket out, tcp in, tcp out, tcp request, udp in, udp out, amqp in, amqp2 in, stomp in, amqp out, amqp2 out, stomp out
- sequence**: split, join, sort, batch, parser (csv, html, json, xml, yaml, base64, msgpack), storage (file, file in, watch, ftp in, mysql, tail)
- social**: email, twitter in, email, twitter out, advanced (feedparser), NGSI (NGSI Entity, NGSI v2toLD), Iwm2m (Iwm2m client in, Iwm2m client out), location (turf, worldmap, worldmap in, tracks, convex hull), time (sunrise)
- dashboard**: button, dropdown, switch, slider, numeric, text input, date picker, colour picker, form, text, gauge, chart, audio out, notification, ui control, template

**on IOT Edge Raspberry** categories:

- social**: e mail, twitter, irc, e mail, twitter, irc, google plus, google places, google calendar
- Raspberry Pi**: rpi gpio, rpi gpio, rpi mouse, rpi keyboard, camerapi takephoto, rpi dht22, imagecapture, ledborg, Sense HAT, Sense HAT
- storage**: tail, file, mongodb, file, mongodb
- network**: ping

# IoT Applications

- **Data ingestion:** more than 70 protocols IOT and Industry 4.0, web Scraping, external services, any protocol database, etc.
- **Data access:** save/retrieve data, query search on expert system, georeverse solution, search on expert system Km4City ontology, etc.
- **Data Transformation/transcoding:** binary, hexadecimal, XML, JSON, String, any format
- **Integration:** CKAN, Web Scraping, FTP, Copernicus satellite, Twitter Vigilance, Workflow OpenMaint, Digital Twin BIMServer, any external service REST Call, etc.
- **Manipulation of complex data:** heatmaps, scenarios, typical time trend, multi series, calendar, maps, etc.
- **Access to Smart City Entities and exploitation of Smart City Services:** transport, parking, POI, KPI, personal data, scenarios, etc.
- **Data Analytic:** managing Python native, calling and scheduling Python/Rstudio containers as snap4city microservices (predictions, anomaly detection, statistics, etc.)
- **User interaction on Dashboard:** get data and message from the user interface, providing messages to the user (form, buttons, switches, animations, selector, maps, etc. )
- **Custom Widgets:** SVG, synoptics, animations, dynamic pins on maps, etc
- **Event management:** Telegram, Twitter, Facebook, SMS, WhatsApp, CAP, etc.
- **Hardware Specific Devices:** Raspberry Pi, Android, Philips, video wall management, etc.

# A Dashboard Design Schema is provided

In the following section, the schema that should be adopted to design each single Dashboard/view of the solution.

**IV.B.7. Example of Dashboard Schema**  
For each Dashboard or View we suggest to specify:

Name	Vehicle dashboard
<b>Aim</b>	Display vehicle information and measured values
<b>Purpose</b>	Monitoring
<b>Status</b>	Draft
<b>Missing</b>	None
<b>Preferred size</b>	PC
<b>Style</b>	PA
<b>Chat enabled</b>	No
<b>Kind</b>	Active
<b>Data vs Widget</b>	<p><b>Map Widget</b></p> <ul style="list-style-type: none"> <li>Description: map showing the vehicle position over time</li> <li>Kind: monitoring only</li> <li>Preferred Data representation: map</li> <li>Data: <code>Vehicle.latitude</code>, <code>Vehicle.longitude</code></li> </ul> <p><b>DataTable Widget</b></p> <ul style="list-style-type: none"> <li>Description: table reporting the vehicle events</li> <li>Kind: monitoring only</li> <li>Preferred Data representation: table</li> <li>Data: <code>VehicleEvent.eventID</code>, <code>VehicleEvent.dateObserved</code>, <code>VehicleEvent.status</code>, <code>VehicleEvent.kind</code></li> </ul> <p><b>SingleContent Widget</b></p> <ul style="list-style-type: none"> <li>Description: single content showing the total km travelled by the vehicle</li> <li>Kind: IoT App</li> <li>Preferred Data representation: single number</li> <li>Data: <code>Vehicle.kmTotal</code></li> </ul> <p><b>Synoptic Widget</b></p> <ul style="list-style-type: none"> <li>Description: battery shaped synoptic to represent the available energy percentage</li> <li>Kind: monitoring only</li> </ul>

	<ul style="list-style-type: none"> <li>Preferred Data representation: animated synoptic</li> <li>Data: <code>Vehicle.energyLevel</code></li> </ul> <p><b>Time series Widget</b></p> <ul style="list-style-type: none"> <li>Description: to plot the evolution of the velocity and acceleration values over time</li> <li>Kind: SC Business Logic</li> <li>Preferred Data representation: time series plot</li> <li>Data: <code>Vehicle.velocity</code>, <code>Vehicle.acceleration</code></li> </ul>
<b>Client Side Business Logic</b>	<ul style="list-style-type: none"> <li>To be developed in JavaScript into the Dashboard Widget</li> <li>Event driven: .....</li> </ul>
<b>Server Side Business Logic</b>	<ul style="list-style-type: none"> <li>To be developed in IoT App with S4C Dashboard Nodes</li> <li>IoT Application →               <ul style="list-style-type: none"> <li>Event driven: .....</li> </ul> </li> <li>IoT Application →               <ul style="list-style-type: none"> <li>Event driven: .....</li> </ul> </li> </ul>

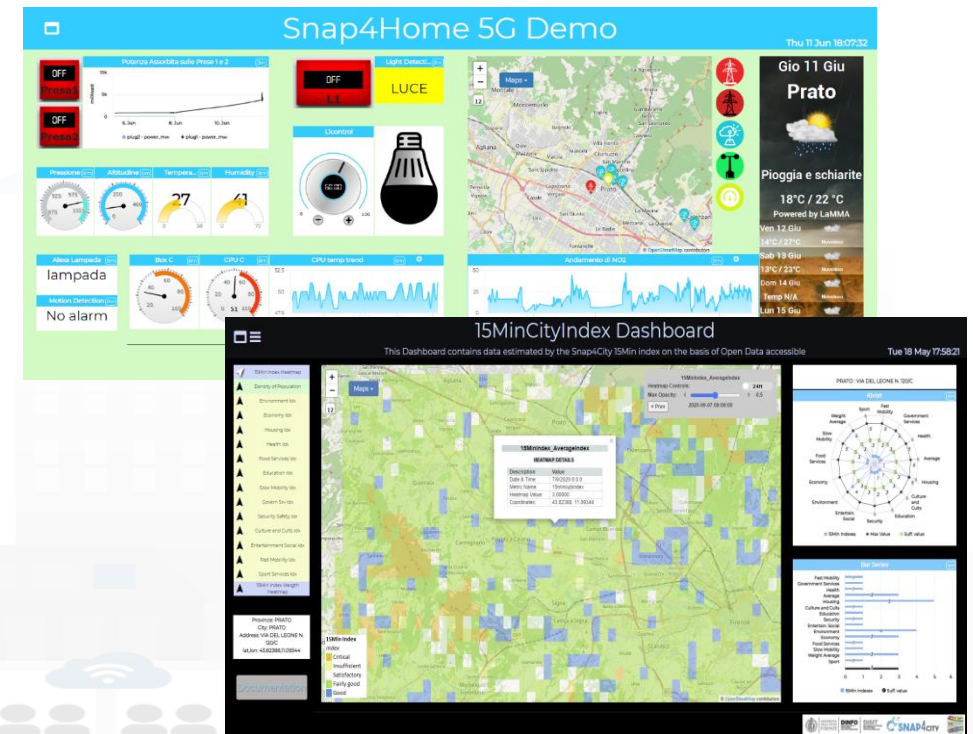

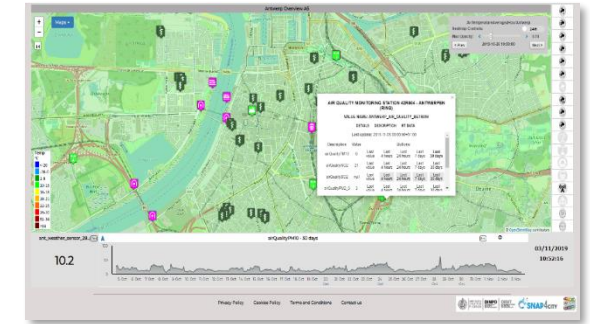

As can be seen in the example dashboard schema above, several information must be specified:

- Name:** name or ID of the dashboard
- Mockup:** a graphical example showing the overall appearance of the dashboard. This can be realized using some graphic painting tool (a screenshot of an empty dashboard can be used as background element)
- Aim:** a description of the dashboard
- Purpose:** it can be monitoring, simulation, what-if, data entry, etc. Multiple values are possible.
- Status:** it can be draft, developed, finalized, accepted
- Missing:** in this field list all missing element that should be included in future
- Preferred Size:** specify the preferred viewing size of the dashboard, such as PC, HD, mobile, or an explicit resolution size (row x column)
- Style:** the base style to be used for the dashboard. Available styles include Gea, Ballon, PA, Ballon Dark, etc.
- Chat enabled:** yes or no
- Kind:** passive or active. A passive dashboard show data taken from storage only, without sending actions toward an IoT App; however, passive dashboards may have selectors, maps, etc., and a lot of interactive visualization that do not requires neither changes in the status on server, nor sending commands to the server side. Differently, active dashboards, are those that send or receive commands to/from the server side, via some client-side Business Logic, server side Business Logic on IoT Apps, or both
- Data vs Widget:** for each widget required in the dashboard, some information must be specified according to the following schema:
  - Name:** the name of the widget to be used
  - Description:** a brief description of the widget and its use
  - Kind:** monitoring, IoT App, or Client-Side business logic (note that, the last two entries characterize an active dashboard)
  - Data:** the data the be used in the widget, typically retrieved from some IoT device. Multiple entries can be accepted.
- Client Side business logic:** to be specified if present
  - Description of the effects: a description of the implemented client-side business logic effects
- Server Side business logic:** to be specified if present
  - IoT App: description of the involved IoT App
  - Event driven: indicate to which events the IoT App responds

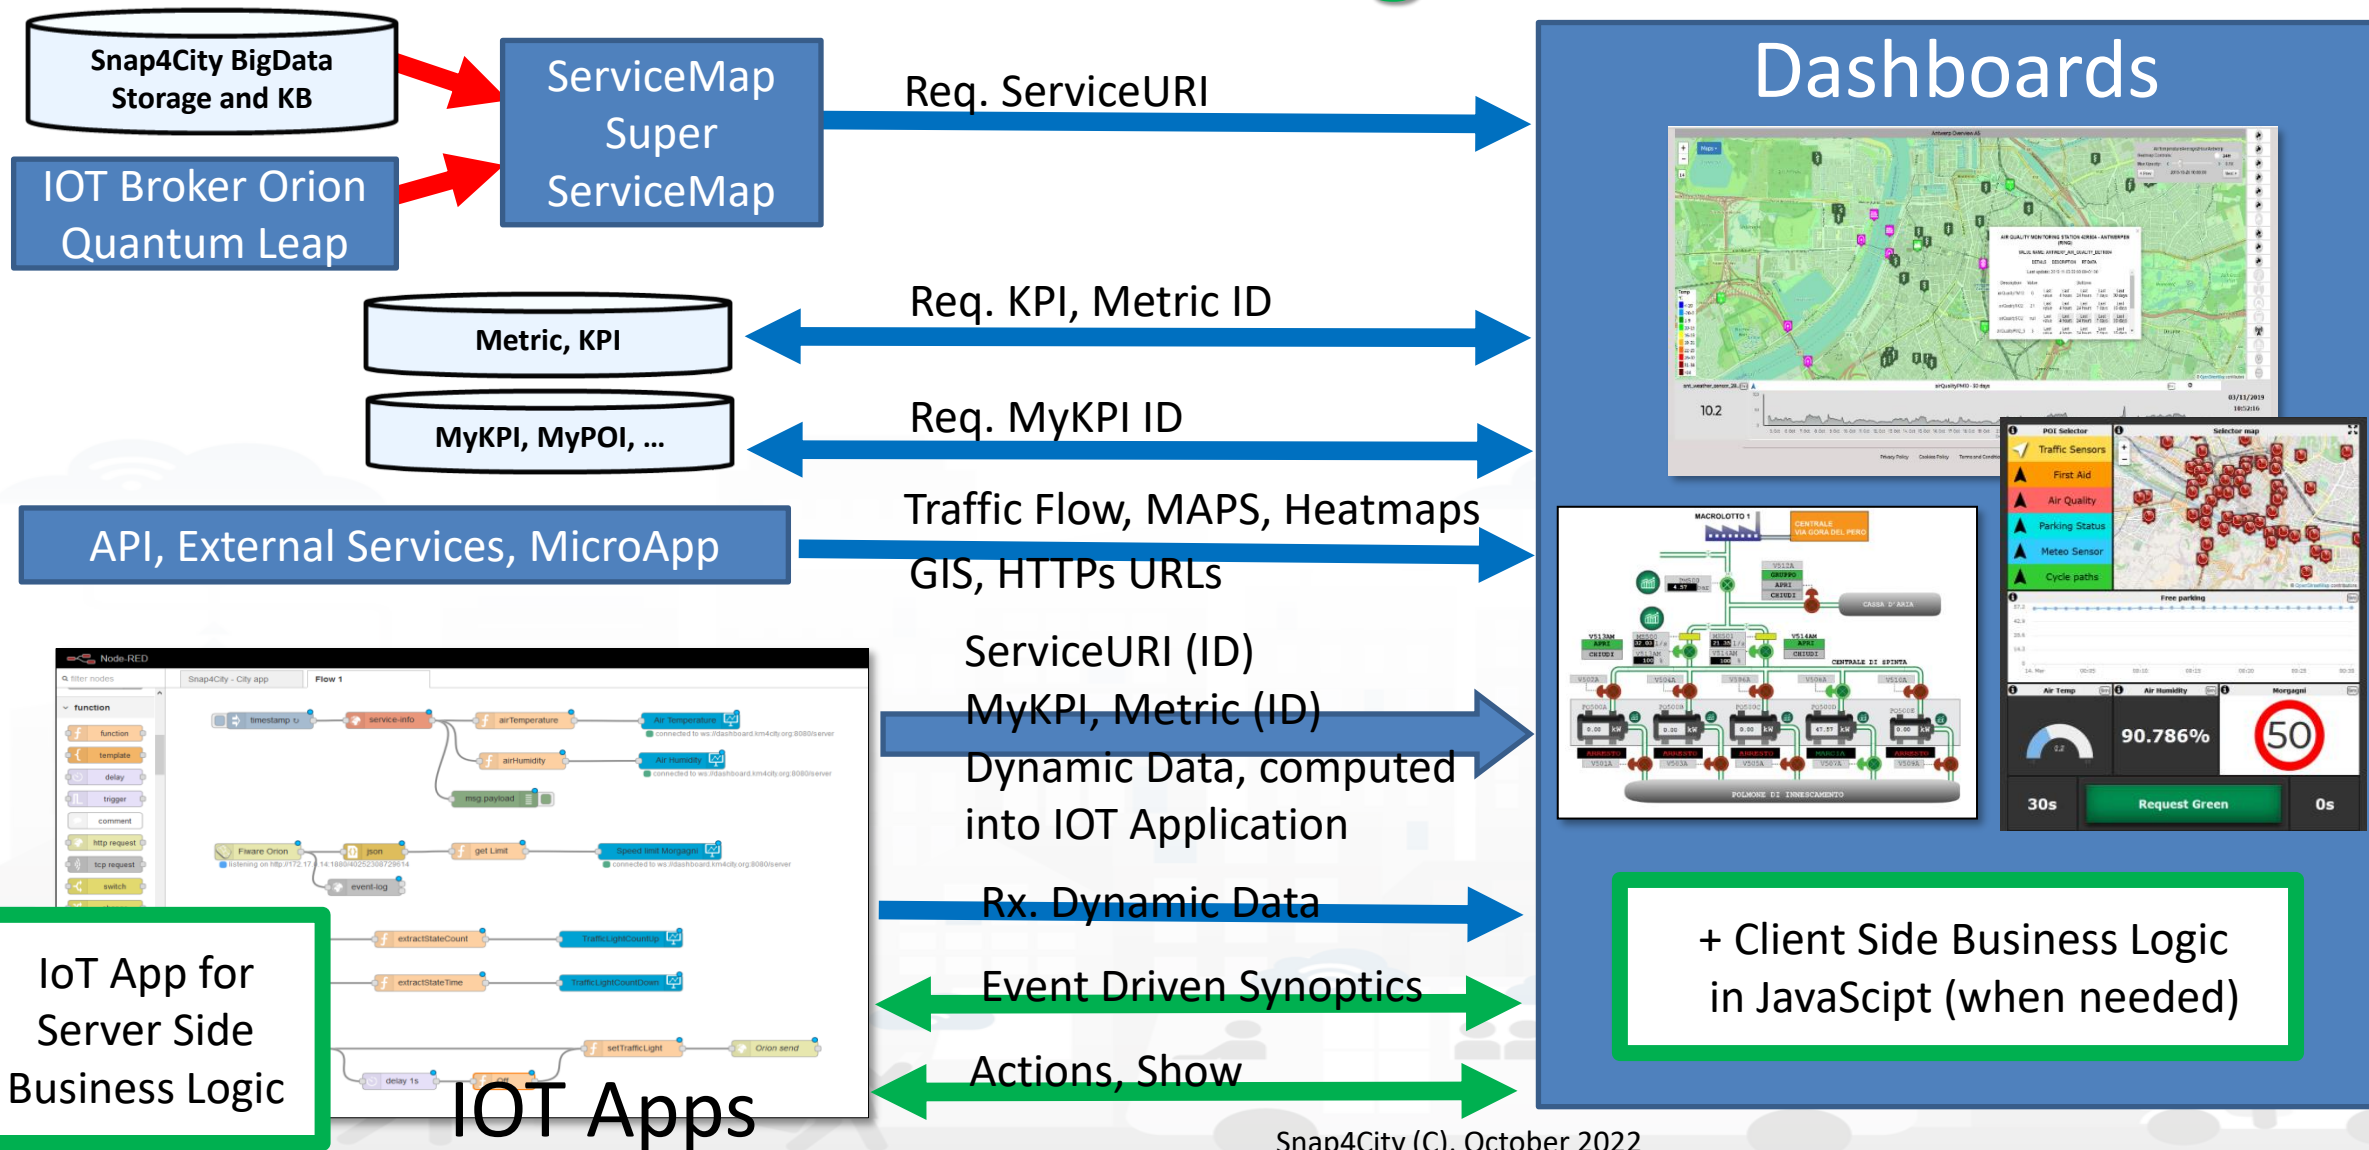

# Dashboard Kind

- **Passive Dashboards:** showing data taken from Storage only, no actions toward IoT App
  - Passive dashboards may have Selectors, maps, etc., and a lot of visualization without changing the status on Server, no sending commands to the Server Side.
- **Active Dashboards, which can be those sending or receiving commands to/from the logic coded somehow and in particular for**
  - **Server Side Business Logic** → logic on IoT Apps with Snap4City Dashboard Nodes, which is easier to be programmed begin based on Node-RED visual programming.
  - **Client Side Business Logic** → logic on JavaScript on specific Dashboard Widgets only for skilled developers of Snap4City Platform. We suggest first prototype by using Server Side Business Logic, then pass to Client Side Business Logic in JavaScript.
  - Both kind of Business Logics may be active on the same Active Dashboard.

# Dashboard Wizard

The screenshot displays the Snap4City Wizard interface during the 'Data and widgets' step. The interface is divided into three main sections: 'Map', 'Data and widgets', and 'Check and summary'.

**Map Section:** Shows a map of Florence, Italy. A yellow arrow labeled 'Select' points to the map.

**Data and widgets Section:** Contains a grid of widget icons. A yellow arrow labeled 'Select' points to this grid.

**Data sources Table:** A table listing available data sources. The columns are: High-Level Type, Nature, Subnature, Value Type, Value Name, Last Date, Last Value, Healthiness, Last Check, and Ownership.

High-Level Type	Nature	Subnature	Value Type	Value Name	Last Date	Last Value	Healthiness	Last Check	Ownership
Special Widget	Environment	Weather Forecast	Prev_Meteo	special weather		Vernio	●	2018-07-08 16:00:18	public

# Advanced IOT Applications

- **Synoptics** can .....
  - do all ☺
- **Widgets** can
  - send/receive dynamic data,
  - change data sources, etc.
  - Provide interactive maps
- **HTML pages** can
  - be dynamically generated
  - provide forms to produce data for IOT Applications
  - Collect files on web and system
  - produce files on web ad system
  - have CSS and AJAX control

- **HTML pages can**
  - be dynamically generated from the IOT App
  - provide forms to produce data to the IOT App, also including interactive elements
  - collect file from users, and produce files to web and to the system
  - have CSS and AJAX controls

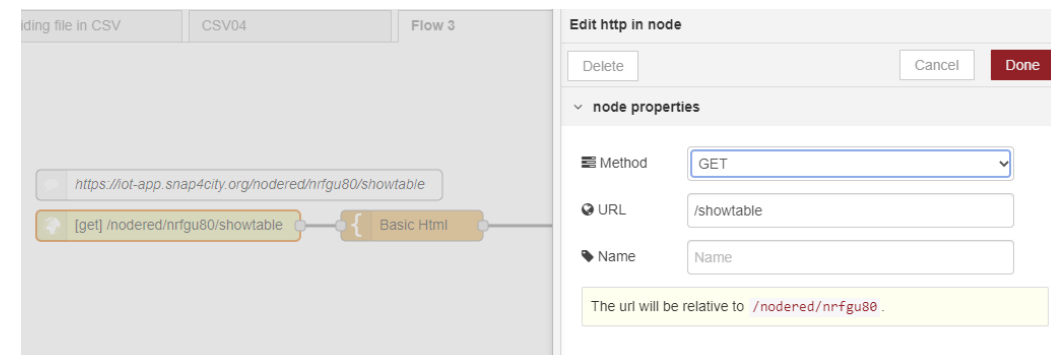

# From IoT App to generate HTML pages, forms

```

<html>
<style>table, th, td { border:1px solid black;}</style>
<head></head>
<body>
<h1>This is a table</h1><table style="width:100%">
  <tr>
    <th>Person 1</th>  <th>Person 2</th>  <th>Person 3</th>
  </tr>
  <tr>
    <td>Emil</td>  <td>Tobias</td>  <td>Linus</td>
  </tr>
  <tr>
    <td>16</td>  <td>14</td>  <td>10</td>
  </tr>
</table>
</body> </html>
  
```

Edit "HTTP IN NODE" as above, also to get the ID of your IoT APP.  
The ID is used in the URL of the generated page

Person 1	Person 2	Person 3
Emil	Tobias	Linus
16	14	10

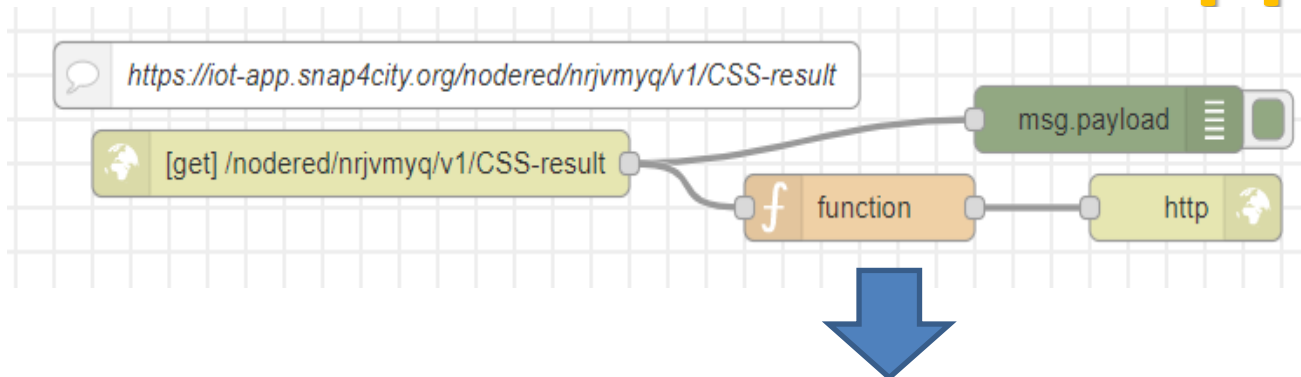

# HTML & Tables on Dashboards

- HTML page can expose forms to collect data for the IoT App.
- The table can be
  - constructed with the style you prefer according to HTML, CSS, etc.
  - dynamically generated on the basis of the values you collect/generate, receive, recover from storage in the flow
  - updated by send a message on the node
  - show on Dashboard by using the link (URL) into an External Content Widget
- In alternative there is to the Widget Table with less flexibility

# From IoT App to API Get

Function receives:

```
{"prova":"1","test":"mio"}
```

It can interpretes the REST call to provide at the next Node the result

**Call on Browser:**

<https://iot-app.snap4city.org/nodered/nrvmyq/v1/CSS-result/?prova=1&test=mio>

Creating MicroServices

Saving / Sharing reusing

Resource Manager

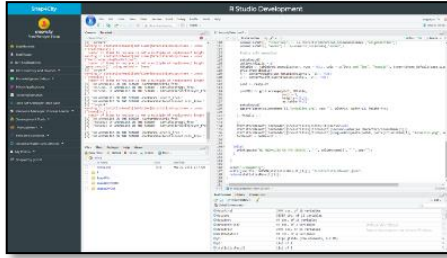

Using them into IOT Applications

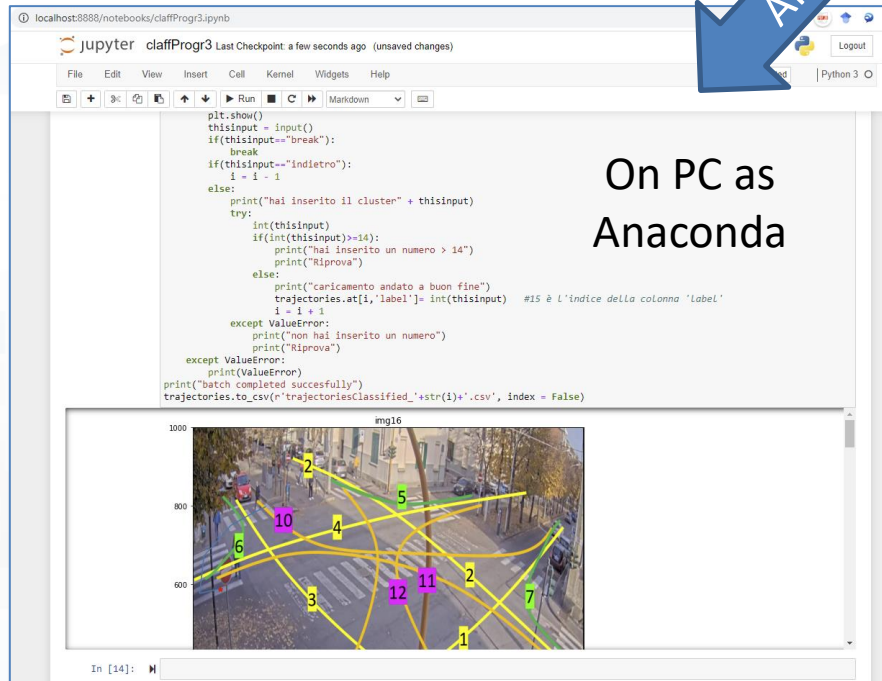

# Development

On Server  
Or  
On PC

On PC as  
Anaconda

File.py  
AI Model  
Mapping  
Data..

Load  
File.py  
or .zip

To make the .PY usable as MicroService you need to adapt it to get and send data in/out with Node-RED from a Container.  
**If you provide a .zip file the main .py inside has to be called doScript.py**

# Data Analytic Container

**1**

Develop .py or .r program on (i) Snap4City platform online, or (ii) your Development Machine.

The code has to respect the guidelines provided. For example see:

<https://www.snap4city.org/641>  
<https://www.snap4city.org/645>

**2**

Open an Advanced IoT App / Node-RED

**3**

Use Snap4City Data Analytic Node, and load in the code you developed

**4**

**5**

Deploy the IoT App → Snap4City Container Manager based on Marathon/Mesos is creating a Container for your Data Analytic code

# *analytics example*

# External Smart City API

The screenshot displays the Snap4City Smart City API Docs: Swagger interface. On the left is a sidebar menu with the Snap4City logo at the top. Below the logo, it shows user information: 'User: roottooladmin1, Org: DISIT, Role: RootAdmin, Level: 7' and a 'LOGOUT' button. The menu includes sections for 'External Services', 'Data Set Manager: Data Gate', 'Resource Manager: Process Loader', 'Development Tools' (with sub-items like Web Scraping Tool and R Studio Development), 'Smart City API Docs: Swagger' (highlighted), 'Internal API Docs: Swagger', 'Testing API by Postman', 'Source Code Access', 'Management', 'Settings', 'User Management and Auditing', 'Help and Contacts', 'Documentation and Articles', and 'My Profile'. The main content area is titled 'Smart City API Docs: Swagger' and features a 'swagger' icon. A dropdown menu 'Select a spec' is open, showing options: 'Advanced Smart City API' (selected), 'Advanced Smart City API', 'Km4city Web App API', 'Orion Broker K1-K2 Authentication API', and 'Heatmap API'. Below this, the 'Advanced Smart City API' section is displayed with version '1.0.0' and 'OAS3' tags, and a URL 'https://www.km4city.org/swagger/external/ascapi-openapi3.json'. A 'Servers' dropdown shows 'https://servicemap.disit.org/WebAppGrafo/api/v1'. The main content lists several API endpoints under different categories: 'Services' (GET / Service discovery and information), 'Events' (GET /events/ Event search), 'Locations' (GET /location/ Address and geometry search by GPS), and 'Public Transport' (GET /tp1/agencies/ Agency list, GET /tp1/bus-lines/ (Bus) Lines list, GET /tp1/bus-routes/ (Bus) Routes list).

# Semantic Reasoning on Smart Applications

- Dashboards have relationships with
  - Org. at which they belong
  - Widgets with
    - data they use, and each of which
      - is connected with the Knowledge Base
      - May be: device, kpi, etc.
  - IoT Apps with
    - Data they use
    - Data Analytic
    - Widget they control
  - .....

# For All Dashboard owners: Graph and Structure

- Go on Dashboard Management

The screenshot shows the 'Management' section of the SNAP4CITY interface. The 'Structure' tab is selected, and a red hand icon points to the 'Link to Graph' button. A red arrow points from the 'Link to Graph' button to the 'Linked Open Graph' window. The 'Dashboard Hierarchy' section lists several dashboards, including 'Energy' and 'Piazza Francia'. The 'Linked Open Graph' window displays a complex graph structure with nodes and edges, representing the relationships between the dashboards and their components.
